## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**CREWE.**—June 12.—Designs are invited for new municipal offices and council chamber. The author of the design which is adjudged best will receive a premium of 50*l.*, and he will be appointed to carry out the design; second premium, 25*l.* Particulars will be supplied by the Borough Surveyor, Municipal Offices, Crewe.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.*, and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford, S.E.

**HARTSHILL.**—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Trent, invite designs for a home for nurses at Hartshill, Stoke-upon-Trent. Particulars may be obtained on application to Mr. Albert E. Boyce, secretary and house governor.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**IRELAND.**—June 2.—The Belfast Harbour Commissioners invite tenders and designs for the decoration and illumination, by electricity or otherwise of the harbour office and the south end of the Glasgow shed, Donegall Quay, in connection with the celebration of the coronation of King Edward VII. Mr. G. F. L. Giles, harbour engineer, Harbour Office, Belfast.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

**WEST HARTLEPOOL.**—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

## CONTRACTS OPEN.

## SUBWAYS IN THE CITY.

IN his report to the Corporation on the subject of the work executed during last year by the Public Health Department the City engineer (Mr. D. J. Ross) states that beneath the City streets there are one and a half miles of subways under the control of the Corporation, but there are other subways not controlled by the City authorities. The lengths of gas, water, telegraph and other tubes laid in the corporate subways extend over eleven miles, being an increase of three miles during the year. The electric-light and telegraph conduits alone contain some thousands of miles of wire. The inspector of subways reports that 15,335 workmen and others were admitted during the year for various purposes. The engineer also submits some figures with reference to the cleansing of the City, within which more than 300,000 persons pass the day and nearly 100,000 carriages enter and leave. The quantity of water for washing was 37,708,690 gallons, while the amount of refuse removed was sufficient to fill 44,975 vans, together with sweepings and slops from the public ways, making a total of 75,090 loads. The refuse destroyed at Lett's wharf was represented by 22,657 loads, which produced a residuum of 3,961 loads of valueless clinker, for the removal of which the Corporation had to pay.

THE new rooms erected in High Barhom, N.B., by the Kilbarchan Liberal Association are now open. Mr. Howie is the architect. The new building, which cost upwards of 1,250l., is built of red stone from Lockerbriggs Quarry, and is a double-storey building, the ground floor containing a reading-room, games-room, ladies and gentlemen's committee-rooms, while the upper floor is to be used as a billiard-room.

VARIETIES.

The new fire brigade station erected by Bingley Urban Council was formally opened on Saturday afternoon.

The chapel recently added to Girton College buildings has been inaugurated. The chapel is constructed to hold 200 persons, and forms part of a large addition to the college.

The new Nurses' Home, which has been erected in Grange Field, West Bromwich, by Alderman Akrill at a cost of some £200, was opened by the Earl of Dartmouth on Monday.

A SPECIAL meeting of the Liverpool Architectural Society will be held at 13 Harrington Street, Liverpool, on Monday, June 9, the principal business of which will be to discuss and approve the revised charges of architects.

The engineers of the Pennsylvania Railroad succeeded on Sunday in moving a steel bridge that spans the Raritan river, weighing 1,836 tons, 174 inches in 175 seconds in order that it might be replaced by a stone bridge. The traffic on the railway, which is notably heavy, was not delayed for a second.

MR. WILLIAM FLETCHER ROBINSON, A.M.I.C.E., has been appointed superintendent and clerk of the sewage outfall extension and improvement works, Chester, at a salary of 20*l.* a month, a month's notice on either side to terminate the appointment.

AT a meeting of the Bournemouth Town Council, held on Monday afternoon, in committee, Mr. G. W. Bailey, town clerk of St. Helens, Lancashire, was appointed town clerk of the borough at a salary of 1,000*l.* per annum. There were nineteen applications.

By an unanimous vote the Northampton Town Council has appointed Mr. Herbert Hankinson, deputy town clerk of Bradford, to the post of town clerk of the borough of Northampton. The salary commences at 750*l.* per annum, and increases by 50*l.* per annum to a maximum of 1,000*l.* There were forty applicants for the post.

A NEW Roman Catholic church at Haunton, near Tamworth, was opened on the 22nd inst. The church, dedicated to SS. Michael and James, consists of nave and chancel, and is built in the Gothic style with Hollington mottled stone, and roofed with Broseley tiles. It is surmounted at the west end with a graceful bell turret. Seating accommodation is provided for 250.

THE corner-stone of the new Episcopal church of St. Devenick, Bieldside, Culter, Aberdeenshire, was laid on Tuesday. The building is in the Gothic style, with Scottish features, and the red and grey granites of which it is constructed form a pleasing contrast. The total length internally is 80 feet; width of nave and chancel, 25 feet; width across transepts, 53 feet. Accommodation is provided for about 250, but this may be increased by the addition of a north aisle and transept, making accommodation for 350. The estimated cost of the church is 3,000*l.*

EIGHTEEN applications for the vacant town clerkship of Leicester were received by the finance committee of the Town Council, and the following seven gentlemen were selected for further consideration:—Mr. Hampton, town clerk of Rotherham; Mr. Hayton, town clerk, South Shields; Mr. Hughes, town clerk, Lancaster; Mr. Jarratt, town clerk, Southport; Mr. Lloyd, town clerk, Huddersfield; Mr. Sanders, solicitor to the Liverpool Corporation; and Mr. Hiley, deputy town clerk of Birmingham. The committee will make a final selection of two names to submit to the Town Council. The salary is 1,000*l.*, rising to 1,250*l.* per annum.

LOAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

THE Earl of Cork and Orrery, Lord-Lieutenant of Somerset, on the 21st inst. reopened the great hall of Taunton Castle, which has recently been thoroughly restored. The archaeological, natural history and philatelic collections recently presented to the Somersetshire Archaeological Society for their museum in the castle were on view for the first time. The first castle on the site was erected about the year 700, and the great hall, which has been restored, was the scene of the "Bloody Assize" held there by Judge Jeffreys. Lord Cork, in performing the ceremony, said that Somerset now possessed one of the finest local museums in Great Britain.

THE new baths and washhouse erected by the Glasgow Corporation for the use of the inhabitants of the Whitevale district of Glasgow have now been completed, and were opened on the 10th inst. The buildings extend from Whitevale Street to East John Street, and cover 2,675 square yards. The estimated cost of the establishment, including ground, is about 37,000*l.* In addition to the baths and washhouse the buildings contain a reading-room, which is entered from Whitevale Street. This is conducted as a branch of the Libraries Department of the Corporation, and was erected to meet the wishes of the late Mr. John Rankine, who bequeathed to the city for that purpose the sum of 3,073*l.* Unlike the other bathing establishments in the city, Whitevale is equipped with a suite of Turkish baths and a gymnasium. The swimming-ponds have been so designed that they may be used as halls during winter, the pond, as it were, being the pit, and this, with comfortable accommodation in the gallery, will give room for about 1,500 persons altogether. The swimming-pond for men is 75 feet by 40 feet, and there are eighty-one dressing-boxes; the pond for women is 50 feet by 25 feet, with fifty-one dressing-boxes. The lesser pond when used as a hall will have sitting accommodation for 750 persons. For men there are twelve first-class and sixteen second-class slipper-baths and twelve spray-baths; for women there are eight slipper-baths. A feature of these bath-rooms is the adoption of marmorite

(tinted glass) instead of wood or glazed brick for partitions. The gymnasium is equipped with the most approved apparatus. Ample accommodation is provided for washing, there being space for sixty-six women using the washhouse at one time. The buildings are well lit from the roof, the walls are covered with white tiles, and the fittings throughout are of an elegant and substantial character.

### TRADE NOTES.

MESSRS. WM. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have received instructions from a sister of the Right Hon. Lord Grimthorpe to erect a new hour striking clock at the parish church, Houghton, near Carlisle.

MESSRS. A. E. PODMORE & CO. (late of Messrs. Henry Greene & Sons) inform us that they have commenced business as gas lighting engineers and contractors, and specialists in electric lighting, at 25A Hatton Garden, E.C.

THE Berkefeld Filter Company, Ltd, of 121 Oxford Street announce that they have again acquired the sole right of selling the "Berkefeld" filter in all British territories and Egypt. The manufacture and sale of "Tubor" filters has been discontinued.

THE Royal box at the Royal Military Tournament, which is now running its annual course at the Agricultural Hall, has been artistically fitted up by Messrs. Oetzmann & Co. Luxurious carpet, dainty furniture and softly-veiled electric light combine to produce a charming effect to which, however, comfort has in no wise been sacrificed.

THE Vacuum Cleaner Company, Ltd, gave on Wednesday at the Alhambra Theatre, a demonstration of the powers of their new cleansing machine, which works on the vacuum principle by extracting the dirt instead of expelling it, as has been done by previous machines. Its effectiveness may be judged when we say that from the stall seats alone some 32 lbs. of dust, to say nothing of germs and microbes, was obtained.

### MAY-OATWAY FIRE ALARM.

Since the recent practical test of this system at Ilford, bookings have been very heavy.

Dingle Station, the scene of the late fatal fire, is now protected by the May-Oatway System and connected direct with the Liverpool Fire Brigade.

The Manchester-with-Chorlton Guardians have contracted with the MAY-OATWAY FIRE APPLIANCES, LTD., to protect their Workhouse from fire.

No person need risk life or property by fire. The MAY-OATWAY automatic bedroom indicator will show on retiring that the house is safe, and wake you immediately and indicate its position when a fire breaks out.

FROM the directors' report to be presented at next day's meeting of the Greenwich Inlaid Linoleum Company, Ltd., it appears that the profit on the year's trading amounts to £9,186/ 3s. 10d., which, together with the £2,588/ 9s. 2d. brought forward, makes £11,774 13s. 6d., from which, after deducting the various items of expenditure, amounting to £1,012/ 0s. 3d., including cost of repairs and renewals of plant, machinery, buildings, &c., a balance of £32,795/ 12s. 9d. remains, and, after charging £5,400/ for the interest on mature stock, which leaves £27,395/ 12s. 9d. for the appropriation account, the directors, feeling the need of prudence, in view of the condition of the markets for linseed oil, recommend the payment of a dividend of 15 per cent. (which absorbs £18,000/), and after providing £1,872/ 13s. 2d. dividend on the shares of the new issue, and paying directors' additional remuneration, that the balance, £7,523/ 19s. 7d., be carried forward to next year.

### ELECTRIC NOTES.

Corporation of Southampton have received the sanction of the Local Government Board to the construction of the electric-light works on the Western Shore, and work will commence to be proceeded with.

THE electric supply of the quarry town of Blaenau Ffestiniog, provided by the Yale Electric Power Company, was completed on the 22nd inst. This Company was formed two years ago for the purpose of developing to some extent the immense amount of water power running to waste in the district, and thereby cheapening the production of slate by supplying power to the quarries during the ordinary working hours for hauling, pumping, mill driving and like purposes; also for lighting the streets and for private consumers. The company are enabled to supply electric light to the latter at 4d. per unit, and to supply power to the quarry companies at 1d. per unit. The company have entered into an agreement with the District Council to light the streets and supply private consumers at 4d. per unit for fifteen years. A banquet was held at the town hall in further celebration, when Lord Newborough presided. It was supported by Sir H. B. Robertson, the Hon. C. H. Wilson, and others.

MR. E. A. SANDFORD FAWCETT, A.M.I.C.E., on behalf of the Local Government Board, held an inquiry at the town

hall, Dudley, on the 23rd inst., relative to the application of the Corporation for sanction to borrow £22,000/ for electric-lighting purposes. Mr. H. C. Brettell, town clerk, explained that the assessable value of the borough was £121,074/., and the population 48,820. There were outstanding loans amounting to £127,928/., and they were awaiting the sanction of the Local Government Board to loans of £10,721/. The loan for which sanction was now asked was to enable the Corporation to meet their statutory obligations with reference to electric lighting in the borough, and was the third in connection with the electrical undertaking, the previous loans being £8,500/ and £33,000/ respectively, the former of which was required to enable the Town Council to fulfil their contract with the tramway company, and the latter for the provision of the power station. The first year's operations resulted in a loss of £80/ 6s. 10d., and last year there was a net profit, in excess of repayment of principal and interest, of £92/. Mr. R. Wilson (consulting electrical engineer) observed that the tramways belonged to a company, but the Corporation were under a contract to purchase them at the expiration of the lease. The company would continue to work them under a lease from the Corporation, and were under a perpetual arrangement to take the current from the Corporation at a price to be determined every five years. The power station had now a capacity equal to 700 kilowatts, and in order to meet the increasing demand it was proposed to lay down a 500 kilowatt machine and dynamo, the remainder of the money being required for the provision of street cables. The Inspector promised to report the whole matter to the Local Government Board, and the proceedings terminated.

### BUILDING AND BUILDERS.

THE foundation-stones of the new Primitive Methodist chapel at Antingham, Norfolk, were laid on the 19th inst.

THE plans prepared by Mr. McGregor Chalmers, architect, for the restoration of the parish church of St. Andrews, N.B., have been accepted.

LORD BURTON has offered to build a new church at Horninglow, Burton, at a cost of £14,000/. Bass & Co. give £3,000/ to an endowment fund. This makes half a dozen churches which have been built by members of the firm.

Two blocks of residential flats are about to be erected in Hurlingham Road, Fulham, overlooking the Polo Grounds. These buildings are to have roof gardens. Messrs. Palgrave & Co., of Westminster, are the architects.

At the fortnightly meeting of the Tamworth Board of Guardians on Saturday a resolution was passed consenting to the erection of a new workhouse infirmary, in accordance with plans which had been sealed by the Local Government Board. The expenditure involved is 8,951*l*.

The memorial-stones in connection with the new Wesleyan chapel in course of erection at Birtsmorton, Worcestershire, were laid on Whit-Monday. The cost of the new chapel, which is to be a neat little structure with tower and spire, will be about 820*l*.

The tender of Messrs. Whitehead & Co., Ltd., of Clapham, for 19,570*l*. has been accepted for the erection of D'Eresby House, Ealing Common, to be built from the designs and under the direction of Messrs. Palgrave & Co., architects, Westminster. The work is to be proceeded with immediately.

It is proposed to erect a memorial in the Roman Catholic archdiocese of Glasgow to the late Archbishop Eyre, and it has been agreed that it shall take the form of three industrial schools and a chapel at Bishopriggs. A sum of 40,000*l*. is already in the hands of the trustees for the purpose.

The foundation-stone of the new St. Matthew's Church, which is being erected in the rapidly growing working-class district of Southsea, has been laid. The scheme owes its inception to the Rev. Bruce Cornford, vicar designate, and towards the cost of building—estimated at 14,000*l*.—a lady member of the congregation has given a donation of 5,000*l*.

The new church of the Jesuit Fathers at Stamford Hill is to be undertaken at once. The contracts entered into provide for the erection of the whole of the sanctuary, including the choir, the organ loft and the transepts, together with the first bay of the nave, a total length of 100 feet. It is anticipated that the whole of these works will be completed within twelve months.

The York Corporation have in view an extensive scheme for the widening of Nessgate, where great congestion of traffic exists, from its present width of 29 feet to a minimum width of 46 feet, and to this end have already contracted to purchase, at a figure which has been arranged, the Star and Garter inn and other property between the Coach and Horses

inn and the corner of King Street. Overtures have been made for the purchase of the remaining piece of property the corner of King Street.

A SUNDERLAND house builder named Wilkinson is laying claim to a share of a huge fortune now under the control of the Chancery Court. Upwards of seventy years ago a Richard Heatherington died, leaving property in Hampshire which has since been administered in Chancery, and is said to be worth now about two millions sterling. Wilkinson claims to be one of ten persons entitled to a share of the fortune, and arrangements are being taken to recover the money.

The foundation-stone was laid at Falkirk on the 15th inst. of a new school, which will be known as the Carmuir school. It is a two-storey building. There are in all seven classrooms on the ground floor, and the same number on the first floor, giving accommodation for 800 children, and there is, in addition, a cookery-room on the second floor, which will accommodate forty pupils, and will be fitted up with all necessary cooking utensils and appliances. The school is a commodious building, and should sufficiently meet all requirements of present day elementary education. It is built of red rock from Closeburn Quarry, Dumfriesshire, and cost about 10,000*l*.

A BLOCK of residential flats and shops called Universal Mansions are just completed at Lower Richmond Road, Putney, overlooking the starting-point of the Oxford Cambridge Boat Race. The property occupies a frontage on the Lower Richmond Road of 111 feet 6 inches, and to a depth of about 97 feet. The contractors were Messrs. Whitehead & Co., Ltd., Clapham, and the architects Messrs. Palgrave & Co., 28 Victoria Street, S.W. The cast wrought ironwork was supplied by Messrs. Hawkins & Bayly, and the electric lift, with patent automatic press-button attachment, by Messrs. Child & Co. The building is fireproof throughout.

The foundation-stone of the new Dean parish church, Edinburgh, situated between the Dean Path and Ravenscroft, was laid on the 24th inst. The new church will occupy the site of the old building, and its cost, including spire, is estimated at 10,000*l*. It will be in the Early English style of architecture, and will consist of nave, side aisles (to be used as passages only) and transepts, together with suitable galleries. Sitting accommodation will be provided for 300 persons. There will also be a hall, seated for 300 persons,

ing-rooms. The church is being erected by Mr. William Layson, builder, from designs by Messrs. Dunn & Findlay, architects.

ON Wednesday evening last the new Liberal club at Ton, Cheshire, was opened by Sir John Brunner, Bart. The building consists of large hall with gallery and is capable of seating, in all, about 700 people, billiard-rooms for three tables, which can also be thrown into large hall means of folding screens, dining-room, cloakroom, committee-rooms, kitchen and servery, secretary's office, four rooms, heating-chamber and cellars in basement. A dah has been placed along the west front which overlooks bowling-green. The walls are of brick with red-pressed bricks and white plaster gables. The roof is covered with slate. The internal work is pitch-pine varnished. The heating is by low-pressure hot-water pipes and radiators. The contract has been carried out by Mr. James E. Evans, of Ton. The heating was done by Mr. Lewis Hill, Liverpool, the architect was Mr. T. T. Rees, F.R.I.B.A., May Build- ing, North John Street, Liverpool.

THE foundation-stones of a new Wesleyan chapel at field, in the Ripon Circuit, were laid on the 20th inst. The building is to take the place of the present chapel, which is antiquated and inadequate to modern requirements. A site adjoining the old chapel, half a rood in extent, situated on the north side of the road in the centre of the village, has been secured from the Marquis of Ripon. The new structure will be reached from a porch on the east side, and will accommodate eighty-one adults. There will be two rows of pews with an aisle down the centre, the rostrum being at the south end. At the opposite end to the rostrum, and entered from the porch, a parlour has been designed, which will afford seating for twenty persons. The latter room is separated from the main hall by a readily movable wood partition. The building is designed in the Early Gothic style, and is to be faced on the east and north fronts with red pressed bricks, and the roof is of blue slated. Internally the walls are to be plastered, the ceilings, dados, doors, &c., being in varnished pitch pine. The whole of the work has been let in one contract to Mr. J. Coldbeck, builder, Ripon, the amount being 478l. 10s. The plans and specifications have been prepared by Mr. J. Stokes, architect, Thirsk, and the work is being carried out under his supervision.

THE foundation-stone of the Presbyterian church, Muswell Hill, N., was laid on May 23. The church is designed in the Perpendicular period of Gothic architecture freely treated. Externally the building is faced with whole white flints, the dressings being of red terra-cottawork. A bold square tower, terminating in a quaint spirelet, forms a prominent feature at the angle of the block, the site being a corner one. There are three bold and richly moulded doorways in front, flanked by buttresses, and a handsome seven-light traceried window in central gable, and traceried work in the apex of gable. The plan approximates in form to a Greek cross. The ceiling internally is vaulted, the large central vault being carried up higher than the others for effect and better ventilation, and being carried upon clustered granite columns with moulded stone bases and carved stone capitals, and these support four main moulded arches and other smaller ones spanning to the walls. The windows are all filled in with ornamental lead lights. Electric lighting and low-pressure hot-water heating apparatus have been installed. The seating accommodation is:—On ground floor, 615 adults; in choir, 34 adults; in end gallery, 81 adults—total 730. The contract is let to Messrs. Johnson & Co., Belle Vue Road, Wandsworth Common. The architects, whose designs were accepted in a recent competition, are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, W.C.

A CHURCH is in course of erection at Cotteridge, King's Norton, which will cost 19,000l. The style of the church, which is to be dedicated to St. Agnes, will be a modern adaptation of that prevailing at the close of the fourteenth century. The building will be erected in brick, with judicious application externally of buff terra-cotta and green Quarella stone. The plan consists of a chancel with flatly coated apsidal end, 35 feet long and 27 feet wide, out of which the organ chamber opens on the north side. The transept has a seating capacity for eighty-one, and will be used as a morning chapel. There is a massive tower at the west end of the south aisle fronting the road, with belfry for six bells; the tower storey forms a large porch. A corridor flanking the south side of the chancel gives direct access to the mission-room at the back of the church, in which are situated clergy and choir vestries. The choir stalls are the old ones from the recently demolished Christ Church, Birmingham, and will have to be altered somewhat to suit their new position. The designs for the church are those of Messrs. Cossins, Peacock & Bewlay.

PLANS are now being drawn for an hotel to be erected in Ashland, U.S.A. which, when completed, will be absolutely unique among Maine hostleries. Owing to the situation of Ashland, in the heart of the lumbering districts, the hotel, says the *Bangor (Maine) Commercial*, is being designed to accommodate two classes of customers. One will be the general travelling public, and the other will be the woodsmen. The two departments will be entirely separate and distinct. This is the first time that anything in the nature of a first and second-class hotel has ever been attempted in Maine, and the result of the experiment is being awaited with interest. The hotel will be three storeys high, and will have a flat roof. The main building will be 66 feet by 32 feet, and the two wings will each be 28 feet by 21 feet. Ashland is situated in a rich lumbering district, and the lumbermen frequently stop there on their way to and from the woods on various short trips from the camps. The average Maine woodsman at such times is inclined to be noisy. In addition to the lumbermen, there are many commercial travellers who visit Aroostook towns, besides the general travelling public. The majority of these persons object seriously to being turned into a common dining-hall with the lumbermen. These objections, in many instances, have been proved to be well founded. If the hotel proves a success, the public may be prepared to see them spring up all over the State.

#### BUILDING IN GREECE.

IN a communication to *Stone* from Mr. D. E. McGinley, he says:—Roofing tiles are manufactured in immense numbers in Greece. In and near the cities and large villages, there is scarcely any other kind of roof in existence; but in the mountain villages some of the roofs are covered with flat stones, or slabs of stone.

Tiles are manufactured in or near every city or town of any size in the kingdom, suitable clay for the purpose being plentiful and widely distributed. The tiles are made by hand, the only machinery used being a simple and primitive "mixer," turned by a horse or mule, which mixes the clay in a pit in the ground.

Nineteen-twentieths of the tiles used are of the old shape, and there are two sizes. Each tile is four centimetres (1·5 inches) wider at one end than at the other. The two sizes are of the same length—45 centimetres (17·7 inches). The small size is eight centimetres (3·1 inches) wide at one

end and 12 centimetres (4·7 inches) at the other. The large size is 12 centimetres (4·7 inches) wide at one end and 18 centimetres (4·6 inches) at the other. Sometimes tiles are laid in mortar, but usually they are kept in place by their own weight.

Of late years a new tile, known as the "Belgian tile," is coming into limited use. It is flat and of a rectangular form with hollows on the upper side to carry off the water. The hollows and projections so arranged as to fit into the projections and hollows of the overlapping tile, thus binding each to the other and keeping them in place. The Belgian tile is the best tile for a steep roof.

With the exception of those located in and near Athens, the outfit of the Grecian tile manufacturers is neither elaborate nor costly. A tile manufacturer of the smaller towns often carries his entire outfit on the backs of two or three donkeys, and thus moves his plant from village to village wherever there is a demand for tiles. Drain tiles and chimney tiles are made in considerable quantities. Nearly all chimneys on dwellings in Greece are simply tiles built up the walls of the building and extending to three feet above the roof. Ventilators are made in the same way.

With the exception of those producing marble—of which there are many good varieties—magnesite, or other minerals, the mountains of Greece are principally limestone. Very few cities or villages of the kingdom are far from a limestone quarry, and the houses are frequently built of this material. Many of the best buildings being faced or ornamented with marble. But most of the houses even here in Athens are of stone and stuccoed on the outside—and often on the inside—and painted in good imitation of marble. This stucco has many years on the exterior of buildings in this climate, where frost is seldom seen, and is cheaper than marble.

In some country villages, where the quarries are very far away or the roads are bad, houses are often built of sun-dried brick; but in portions of northern Greece, especially in small villages of Thessaly, houses are built by first erecting a frame of willow poles and rods and then covering this with work with a coating of mud or clay mortar.

Sun-dried brick are used in considerable quantities. The humbler houses in the suburbs of the cities of Athens, Piræus, and Patras, and in many villages where stone is not plentiful or easy of access, are built of sun-dried brick. In fact, in some villages the houses are nearly all built of this material. Fences or walls throughout the country are composed of brick

ay one yard square and half a yard thick, made in a somewhat similar to the manufacture of sun-dried. The brick, as the name implies, are dried by the heat of the sun only. They vary in colour, according to the colour of the clay used, and measure about 12 by 6 by 2½ inches. The brick are made in every village, town, and farm in the country that has clay, and there are few places in the kingdom where there are no clay deposits. The annual quantity manufactured is not known. They are sold by the number, at from 1·75 pence per thousand. They are sometimes laid in lime mortar, but more often in mud or clay mortar. Sun-dried or burned brick are manufactured in or near Athens, Volo, Chalkis, Pyrgos, and elsewhere in Greece; they are of a hard quality, and usually of a very light cream colour. It is said that no soft kiln-burned brick are made. Sun-burned brick are used for the erection of chimneys in houses, foundries, &c., partitions in buildings, bakers' ovens, furnaces, and sometimes for building drains and sewers. Chimneys or "smoke stacks" are seldom erected. On account of the limited use of kiln-burned brick in the country, the manufactures of this material are few. There are but four or five of importance, and even those do not make brick exclusively—they also manufacture tile. Like the sun-dried, the kiln-burned brick are made by the same machinery used being the simple "mixer" driven by horse-power. The kiln-burned brick measure about 11 by 4½ by 1½ inches. One man can mould 3,000 each day. The annual product of the manufactures of the kingdom cannot be learned. After the bricks are moulded, they are allowed to lie in the open until partially dried and stiff enough to handle easily. They are then built up in an "open-work" manner similar to the method used in the United States, so that the heat from the fire can reach each brick. The fuel used is nearly always coal, and the fire, never very hot, is kept up about fifteen hours. Sun-burned brick are sold by the hundred or thousand directly to the consumer at from 3·50 to 5 pence per thousand. They are very seldom shipped by rail or water, as such transportation is too costly. In building, the kiln-dried bricks are laid in lime and sand on a flat side down, never on the edge; but as the mortar is often bad and gets soft in damp weather, cement is used in laying the brick in a construction which it is desired to make permanent.

NEW CATALOGUES.

MESSRS. JOSEPH CLIFF & SONS have just completed the new Glazed Brick Section of their catalogue, which, beautifully printed as it is in colours and replete with information as to prices, &c., will be found of sterling value to architects and others. In these goods every possible section seems to be included, as well as copings, mouldings, tiles, &c. Messrs. Cliff & Son also make a specialty of brick fireplaces, mantles, &c., in which some admirably artistic designs are shown.

MESSRS. F. BRABY & CO., of Glasgow, have sent us a new catalogue, which, in addition to some useful information, weights of sheets, hoops, bars, zinc, nails, &c., contains illustrated descriptions of their galvanised, corrugated and curved sheets, ridging, skylights, window sashes, sash bars, fixings, W.I. gutters and pipes, ventilators, rustless iron and steel cylinders, boilers, cisterns, furnace pans, sinks, gutters, pipes, gratings, manhole covers, galvanised tanks, cylinders and cisterns, copper cylinders, boilers and furnace pans, sanitary pans and dustbins, cattle troughs and corn bins, tubular garden barrows, &c.

WE have received from the General Electric Company (1900), Ltd., a copy of their new and voluminous catalogue, comprising the various sections which they have issued during the last twelve months or so, together with a great deal of interesting added matter. It contains many well-executed reproductions of the firm's various works, branches and offices, and a host of useful information printed on a pink supplement, comprising tables of weights and measures with metrical equivalents, foreign money tables, data for house wiring, and comparison with gas for private plants, hints to purchasers, and a glossary of electrical terms. For colonial customers a series of estimates for complete plants are included.

The catalogue proper comprises the following sections:—

Switchboard and electric light supplies . . . . .	(S)	80	pages
Wires and cables . . . . .	(W)	56	"
Instruments, meters, &c. . . . .	(M)	42	"
Arc lamps and engineering specialties . . . . .	(E)	112	"
Traction supplies . . . . .	(T)	16	"
Electrical plant . . . . .	(P)	56	"
Electrical heating and cooking . . . . .	(H)	24	"
Electric bells, &c. . . . .	(L)	95	"
Telephones, &c. . . . .	(K)	96	"
Electro-medical apparatus . . . . .	(O)	32	"
Fixtures and glassware . . . . .	(F & G)	272	"

TIME-SAVING OFFICE SUPPLIES.

ADAPTABLE CABINETS, Made with Interchangeable Parts, and may be used either as a set of Pigeon-Holes or as a Cabinet of Drawers only. For octavo, quarto, or foolscap, according to individual requirements. Price of Cabinet, fitted as sketch, in Figured Oak, 45/-, 25½" high.

Illustrated Catalogue and all information relating to Office Supplies free on application to Department F. C.,

PARTRIDGE & COOPER, LIMITED, 191 & 192 FLEET STREET, LONDON, E.C.

At the end of the catalogue there is an art paper supplement with some excellently reproduced photos, showing the great variety of and enormous field covered by the installation work of the General Electric Company—from dynamos and switchboards to lighting and street telephones.

All these sections aggregate close on 1,000 pages, and (with few exceptions, as in lamps, where the varieties are too great) every article has a catalogue number, and every class of article is accompanied by a short and concise description and specification, which can be embodied by contractors in their own estimates. In the switchboard section several types of distribution, accumulator and dynamo-boards are shown. In the matter of central-station switchboards the company's work is well known, but we would draw special attention to the excellent series of "Peel" and "Adelphi" switches. Of smaller articles in this line there is an almost endless variety of point switches, plugs, cut-outs, &c.

Section W deals mostly with the firm's "Omega" wires and cables and flexible wires in great variety for every purpose. Section M includes the "Stanley" series of ammeters and voltmeters made at the Manchester works, and the well-known "Aron" meters made in London, the "Wilson" time switch and the "Stanley" auto-cut-outs, besides many other instruments and apparatus of the same kind. Section E, which follows, commences with the G. E. C. "Angold" arc lamps and gear for same, Lyons's liquid resistances, stage apparatus, "Freezer" fans, and the high-class motor rheostats, controllers and automatic lift controllers sold by the G. E. C. The rest of this section is mostly taken up by transformers, small motors, accumulators and engineering accessories. All the other sections are equally comprehensive. The G. E. C. catalogue has appeared about every two years for the last twenty years, and has on each occasion been the most up-to-date catalogue in every branch of electrical industries, and the present issue in no wise falls below the aim of its compilers.

### ELECTRIC LIGHT AT ST. PAUL'S CATHEDRAL.

THE electric lighting of St. Paul's, which has been in progress for upwards of three years, has now reached a stage of partial completion, and was used for the first time generally throughout the chancel, dome, nave, and crypts at Whitsuntide. The

installation, which has cost nearly £10,000 so far, is a great gift to the Dean and Chapter from Mr. Pierpont Morgan. The difficulties of wiring and lighting so immense a building are considerable, as, apart from the care necessary in pier thick stone walls and floors, now 200 years old, the distance to be traversed are very great, and the basement is a network of tombs and vaults, which have to be avoided.

The work has been carried out under the superintendence of Mr. Somers Clarke, F.S.A., the consulting architect to the cathedral, and Professor Kennedy, the consulting electrical engineer.

The fittings, which were designed by Mr. Clarke, consist of six large pendants of cast and gilded brass in the choir, hanging from the vault, which, in addition to lighting the floor, throw glow on the mosaics of the vault by means of upturned lights concealed in cups. There are also eight heavy bronze pendants under the dome, and two others in the transepts; four bracket lights upon the chancel screens; and a ten-light fitting in the apse, which also lights the Jesus Chapel. The five standards in the nave and two at the west entrance were designed by Mr. Penrose and Mr. Pegram respectively.

In addition to these the choir desks have been fitted with standards holding concealed lights, and the crypt has been lighted throughout with the handsome old gas fittings in the shape of hanging Roman lamps, which have been adapted for electric light.

The same adaptation has been made in the case of the Pegram and nave standards, the bases and pillars of which remain as before, the heads, carrying electric lights in the shape of glass bowls, alone being designed afresh. These glass bowls transmit a beautiful quality of light, and were the result of many experiments.

The choir aisles, the entrances, the consistory court, the whispering-gallery, and several other points in the church have yet to be lighted or provided with their permanent fittings. A few of the large pendants in the dome and transepts have been replaced at present filled by temporary but solid-looking structures of wood and iron. These, together with the arduous work of channelling and piercing the stone walls to receive the steel tubing in which the wires are carried, must be credited to the cathedral's own staff of workmen, under the clerk of works, Mr. Harding.

The switching arrangements for the lights are necessarily complicated, and require the use of large switchboards, one of which can be seen in the crypt. The others are in a location

ember off the staircase in one of the main piers of the building. Current is supplied by two different companies, and each case from more than one station, to minimise the risks breakdown.

As evidence of the care devoted to this point, the lights are alternately on different circuits right through the church. It is computed that sixteen miles of cable, containing more than two and a half tons of copper, have been used in the installation.

### BLACKPOOL OPERA HOUSE.

An important work of reconstruction and enlargement in connection with Her Majesty's Theatre, Blackpool, which is the property of the Winter Gardens Company, is about to be put in hand from the designs and under the supervision of Messrs. Mangnall & Littlewood of Manchester, who were the architects of the Empress ballroom and the Indian lounge, according to whose plans the whole of the Winter Gardens Church Street frontage from the present Opera House entrance to Adelphi Street will be taken in hand, and a new façade of French Renaissance style and very striking appearance will be erected. In design and general features the elevation will very closely resemble the Grand Opera in Paris, a building which, for architectural grace and finish, has a world-wide repute. The building will be carried to the height of the Empress Buildings, but will consist of only two storeys. The present entrance to the Winter Gardens will be embodied in the scheme, and remain in its present position. The existing entrance to the Opera House will be utilised solely for the patrons of the pit. West of these entrances will be three shops, so that the present tenants have no cause of anxiety. At the Adelphi Street corner is to be a handsome square tower 100 feet high, surmounted by an ornamental minaret. This and a graceful dome of about the same height immediately over the Gardens entrance will be striking features of the architectural design. It will further be necessary, probably, to raise the existing dome, which is 100 feet high, in order to harmonise the effect and give a more commanding appearance. The elevation on paper, we can assure our readers, looks splendid; in the structure it will surpass any imaginary creation that can be pictured from this perfect description. With granite pillars to the windows

and the free introduction of friezes, scrollwork, and so on, the effect will have a delightful grace and detailed beauty.

The entrance to the dress circle and upper circle will be under the tower at the westerly corner of the block in Church Street. This entrance-hall will be almost as large as the present entrance-hall of the Opera House. Handsome wide staircases lead up to a magnificent foyer. To use the eulogistic language of its designer, this foyer will be "a dream." It will be 120 feet in length by 40 feet in width, but as a statement of measurement does not convey much idea, it may be said that it will practically have a similar area to that of the Victoria Hall, but much more lofty. From the foyer is an entrance to the dress circle, 20 feet wide, and an entrance to the upper circle of similar proportions. Ample cloak-rooms, ladies' retiring-rooms, &c., are provided for. The appointments of the foyer will have a sumptuous luxury not less than that of the Indian lounge; it will be furnished with handsomely upholstered settees, and will be an ideal promenade or lounge during the intervals of the play. It is further projected to provide afternoon teas here in connection with the matinees. The object is to make the Opera House so completely charming as to appeal to the best people of the district and the best people who come amongst us as visitors.

From the shareholders' point of view, it is the enlargement of the theatre that will probably have the strongest appeal. There is much useless room at the back of the theatre, and this is to be remodelled and thrown into the body of the theatre, with a result that is positively amazing. Increased accommodation will be given for 1,500 persons. The bars at the rear of the pit, the dress circle and the upper circle are to be cleared out, along with several stairways that can be dispensed with, and then there will be practically a reconstruction of the auditorium. Extra seating will be provided in the stalls. The pit will be carried ever so much further back, and the extra seating there gained is for the large number of 750. The circles will be entirely taken down and reconstructed, and by altering the "rake" the occupants will get a splendid line of sight. The dress circle, which now consists of only three rows of seats, will be increased to twelve rows. The upper circle, instead of having eight rows, will have fifteen. There will also be accommodation for 300 or 400 more in the gallery, for whose patrons a separate spacious staircase outside the building will be constructed.

Now that we have indicated the nature and extent of the reconstruction, our readers will agree with the opening remark

that this will be one of the largest theatres in the country. As to the other remark touching its ornateness, that may be left to the well-known good taste of Mr. Huddleston. We are assured that the earning capacity of the theatre will be doubled—that is a big thing to say, it should be enough for the shareholders. The scheme has an element of the novel. Mr. Huddleston calls it a "collapsible theatre." The arrangements provide that in the winter the gallery "gods" can be admitted from their special entrance to the upper circle, and the gallery can be closed. Throughout the theatre attention has been given to the adequacy of the exits, and these are exceptionally numerous.

We understand that the cost of the work will amount to between 20,000*l.* and 30,000*l.*

### CORONATION STANDS.

THE construction of a grand stand for the Coronation is a more elaborate matter than it looks. In some cases, says the *Daily News*, the plans have passed through the hands of two architects before being submitted for the necessary sanction of the local authority's surveyor. At the time of the Diamond Jubilee responsibility for structural safety rested with the County Council, and it was judged a feather in the Spring Gardens cap that of the multitude of various temporary erections none yielded under its burden of excited humanity. Since then the law has been changed, and the supervision devolves upon the local body. Thus the County Council itself has had to obtain the signatures of the Westminster surveyor to the plans for its structures in Trafalgar Square and the Strand.

Nearly all the large stands are being erected on sites that chanced to be in the builders' hands. In some cases the work of demolition has been hastened, so that there shall remain only as much of the old building as will form a convenient base for the temporary structure. In other cases, where the site had been already cleared, the pressure has been to complete the foundations and basement of the new buildings, so that they equally may be a groundwork for the staging. On some sites, as that at the corner of Pall Mall and Waterloo Place, a Scotch derrick crane—startling columns of woodwork rising to a height of 100 feet, with 7 tons of machinery atop—are seen at work, hoisting into position the 3-ton stanchions

necessary for the basement of the permanent building. Naturally it will not be worth while to remove these derrick cranes—whose construction involves the protracted labours of men specially trained—in the interests of the Coronation stands. Those structures will be built around the dizzy columns of woodwork, space for a few seats thus being sacrificed.

The timber yards are daily sending forth, in addition to their ordinary output, hundreds of loads of pitch pine (the principal material for these Coronation structures), besides hundreds of standards of deals (for the braces of joists). Thousands of bolts, nuts and washers are absorbed in the process of knitting together the multitudinous details of each stand, and a goodly number of "dogs" are required for holding sleepers in conjunction. Of those massive parts a great number are needed where, as in Trafalgar Square and the Strand, of Charing Cross terminus, the constructors are debarred from sinking any of their posts into the ground. It is not possible to speak definitely concerning the cost of building a stand, the number of men required for the operation. Both factors are, of course, controlled by the special circumstances of each case. But in the Charing Cross example our representative has been informed that it is to accommodate about 2,000 persons, and that the cost will be between 2,000*l.* and 3,000*l.*, a statement associated with the assurance that as a rough average, the price of Coronation stands may be calculated on a basis of 1*l.* per seat. It will be noted that this estimate is as nearly as possible confirmed by the arrangements of the County Council. As to the amount of labour involved, it was further stated, in regard to the Charing Cross structure, that nearly a hundred men may be engaged on work in its later stages, though it occupies a considerably larger number at present. In another quarter it was mentioned that between thirty and forty men would in one month erect a stand, with refreshment saloon and cloakrooms, to accommodate a thousand spectators. Owing to the painfully overstocked labour market, few carpenters are likely to have a chance of "overtime," or of any increase on the 10*s.* 6*d.* per hour rate of pay which has now obtained for two years.

The question is sometimes asked, "What will become of the wood when the stands are taken down?" It is a question easy to answer. Builders, in tendering for the construction of a stand, submit a price on the understanding that the materials shall revert to themselves. Pitch-pine, deals, sleepers, posts, "dogs" and bolts are among the things of which they are in constant need for hoardings, shorings and buildings.

# The Architect.

## THE WEEK.

One of the most interesting potentates who has come to London for the Coronation is the Maharaja of JAIPUR. Among the Indian princes he has been pre-eminent in his efforts to uphold native art. He has not been satisfied with endeavouring to have Indian styles produced in modern works. His Highness has also directed costly volumes to be prepared and published in which measured details of the architecture of the district are given for fire use. Whatever may be the fate of Indian work, there will always be a record of its characteristics. The Maharaja owes much to the co-operation of the political officer, Colonel JACOB, C.I.E., who has been most zealous in his efforts to gain appreciation for Indian art in this country. He now accompanies the Maharaja. The demonstration with which His Highness was welcomed at Dover on Tuesday was due to a wise ruler who has ever been loyal to the English administration of the Indian Empire.

M. JULES HENRIVAUX, who was formerly director of the great French glass factory at Saint-Gobain, has become an advocate of a new building material, for which he anticipates sooner or later a prodigious demand. It is a brick made of what he calls stone-glass. The strength of it is not surpassed by any of the building stones, for it can sustain as much weight as a granite block. One of the stone-glass bricks has been found irresistible to blows with a hammer. Another advantage is that colours of all varieties can be imparted to the brick, and will enable it to be used for ornamental purposes. According to M. HENRIVAUX, glass can be employed in buildings from the foundations to the roof. Stone-glass is also applicable to pipes for air, gas, electric wires, &c. It is needless to say the use of glass bricks has been recommended for many years, but it has never been attempted except on a limited scale. It is remarkable that, while glass is suggested to be used instead of stone and brick, thin stone has come into popularity in Germany as a substitute for glass in factory windows.

WHEN the case relating to the Roedean school at Brighton came before Mr. Justice BUCKNILL we referred to the circumstances. The point at issue was the extent of an architect's powers as arbitrator in a work which was carried out under his superintendence. In 1897 a contract was entered into by Messrs. PETERS & SON with the Roedean School Site and Buildings, Ltd., for the erection of a school at Brighton which was to cost over 43,000*l.* The work was to be completed by September 1, 1898. It was agreed that all disputes were to be referred to the architect, Mr. J. W. SIMPSON. As the work was not finished on that date, and the builders became bankrupts, notice was given for determining the contract, and the building was completed under the architect's direction on June 27, 1901. A final certificate was prepared, which testified that some hundreds of pounds were due to Messrs. PETERS. Their solicitors then informed the Roedean Company that they claimed damages for improperly determining the contract. The company requested the architect to arbitrate on any differences which were raised. On one side were a Mr. DAVIS, who possessed an interest in the contractors' business, and a Mr. BELCHER, who had advanced money to the contractors, besides others who had also claims on the settlement. Even, however, the arbitration was about to take place, Mr. DAVIS's solicitor served on the arbitrator an injunction restraining him from proceeding with the inquiry. Another protest came from Mr. BELCHER. The proceedings were delayed, but eventually the inquiry was held and the award was made on April 9, 1902. On the 11th the company sought to enforce the award, and on the 14th a writ was issued on behalf of Mr. BELCHER, in which it was stated that the company had illegally obtained possession of the site and determined the contract. The company were unsuccessful in attempting to stay the action or to enforce the award.

The case was therefore brought before the Court of Appeal, the question being whether Mr. BELCHER should be permitted to continue his action, as the matters in dispute had been determined by the arbitrator. On the other side, it was contended that the trustee for the contractors had a rightful claim to be paid *quantum meruit* for work and materials. As they were not allowed to complete the work under the contract, the contract itself was at an end, and the whole work should be measured up. The Master of the Rolls and the Lords Justices came to the conclusion that as all the parties had agreed to the architect's jurisdiction as arbitrator, they could not after the close of the proceedings say the award was bad or that the arbitrator had exceeded his powers; the award should be enforced by the company, and Mr. BELCHER's action stayed. The position of the architect as arbitrator has been therefore once more upheld in a case which presented some novelties.

FORTUNE has favoured young artists in this year's Salon. For architecture the Médaille d'honneur was awarded to M. EUSTACHE by a majority of votes. He won the Prix de Rome as late as 1891, and the drawings he exhibited were inspired by his studies in the Eternal City, for they formed a restoration of the Via Sacra. First-class medals were obtained by MM. BRUEL (ALEXANDRE); GUADET and PRUDENT; second-class medals by MM. MALGRAS-DELMAS, GUINOT, GROMORT, BRUNET; and third-class medals by MM. CHANU, JAUSSELY, NARJOUX, PARMENTIER, OLLIVIER, SANTERRE. In the section of painting M. JOSEPH BAIL has carried off the Médaille d'honneur by his *Dentellières*. He is son of M. ANTOINE F. BAIL, who is an excellent painter, and his brother has also distinguished himself in the art. M. HIPPOLYTE LEFEBVRE receives the medal in sculpture for his group of blind girls listening to music. He obtained the Prix de Rome in 1882, when he was eighteen. A première médaille was not awarded to any painter. Those for sculpture were gained by MM. CHAMPEIL, CARL LECOURTIER and BEGUIME.

THE late Mr. CHARLES GASSIOT, of Tooting, has bequeathed to the Corporation of London a most important collection of pictures. As, however, Mrs. GASSIOT is to have the enjoyment of them during her life, they will not be immediately available for the benefit of visitors to the Art Gallery. Among the works are CONSTABLE'S *Fording the River: Showery Weather*, for which 10,000*l.* was offered; four works by NASMYTH; seven by WILLIAM COLLINS, R.A.; seven by CLARKSON STANFIELD, R.A.; seven by JOHN PHILLIP, R.A., and two by W. J. MÜLLER. There are also examples by THOMAS FAED, WILLIAM DYCE, E. LANDSEER and T. CRESWICK; four by Mr. J. C. HOOK, R.A. MILLAIS's popular *My First Sermon* and *My Second Sermon* are also given, with Sir ALMA-TADEMA'S *Pyrrhic Dance* and Mr. BRITON RIVIÈRE'S *The King Drinks*. Mr. GASSIOT has bequeathed to the National Gallery JOHN PHILLIPS'S *The Prison Window* and *Gossip at a Well*, besides one by WILLIAM COLLINS and one by NASMYTH. It is to be hoped that before the pictures arrive at the Guildhall some arrangements will be made to allow them to be properly exhibited.

TEN years ago when the tercentenary of the foundation of Trinity College, Dublin, was celebrated, it was decided to erect a memorial of the occasion. The form adopted was that of a building in which accommodation could be found for the various scientific, literary and theological societies recruited by the students of the college. The commission for the building was given to Sir THOMAS DREW. The work having been completed was opened last week by the Lord-Lieutenant. The style is in keeping with the older buildings, which are reputed to have been designed by Sir WILLIAM CHAMBERS, although a letter exists in which he said he declined to have any connection with the college. Additional quarters for students have also been erected. The expenditure has been about 25,000*l.*, of which a third was derived from past and present graduates.

## PEACE AND PROSPERITY.

SOME of the continental journalists are puzzled about the best term to employ for expressing the end of the contest in South Africa. They hear of the satisfaction with which the news of the surrender was received by all classes and parties in this country, but the customary absence of self-glorification among Englishmen excites misgivings in the minds of those publicists that the true value of our success is known to us, and as we have made no fuss about it therefore it is of little importance. During the war between the Cavaliers and Parliamentarians we are told by CLARENDON how Lord FALKLAND was always uttering the word "peace," as if it combined all his desires. Not only in Great Britain but throughout the British colonies no word has been so often used since Sunday last. Compared with the attainment of peace all questions relating to the termination of the contest, whether it was a capitulation, a suppression of resistance, a negotiation, a resolution or an agreement, are held to be of minor interest. What was sought after by the Government and the Empire was expressed by the Secretary for War when he wrote on April 16:—"We have been from the first anxious to spare the effusion of further blood and to hasten the restoration of peace and prosperity to the countries afflicted by the war." Not a peace which was only verbal was desired, but an assured peace bringing with it, as its foremost effect, prosperity.

The condition of mind which converts the pride, pomp and circumstance of glorious war into a material prosperity on which taxes can be levied seems to be as unreal to foreign critics as the utilising of swords for ploughshares. They need only, however, once visit London or any large English town to discover that it is no new condition. A walk through the streets of the Metropolis is enough to demonstrate how glory is valued among us. Britain has been engaged in many wars, but where are the Arcs de Triomphe, the gates of victory and the trophies which are met with in most foreign cities? There is a Waterloo Bridge in London, but it owes the change in its title to a resolution of a company of shareholders. Trafalgar Square received its name in order to give appropriateness to the erection of the Nelson column in a place which was known from the royal stables, which occupied the site. Small streets occasionally are called after military heroes, and their names may be seen surmounting public houses, but all these are individual testimonies of admiration. We have not even the smallest temple of military glory, and many of our bravest captains have not a tablet to serve as a memorial. All this should be enough to convince censors that what now rejoices England is not the triumph over enemies who have fought a good fight against us, but the prospect of the establishment of peace. Compared with the people who were led from victory to victory by NAPOLEON, and who in the end cheerfully submitted to immense sacrifices for the sake of *gloire*, we are only a nation of shopkeepers, but in the general interests of the world it may be as well we are what we are.

It is therefore allowable at the present time to follow the example of the Secretary for War and to think of prosperity as the desirable outcome of peace. There is no doubt that, owing to the war, building in general has suffered more than the majority of businesses. At first we underrated the power of the Boers, and subsequently it was supposed that their resistance might lead to complications in which we should have still stronger enemies opposed to us. At such a juncture capital, which is the most sensitive of all forces, was not to be obtained on equitable terms for the erection of buildings. Prior to the Boer War there was a prospect of a period of prosperity for all who were connected with the building trades, but it was set aside, and for the last two years the progress of building has been retarded, and much inconvenience has been experienced. We may now expect a resumption of profitable operations, when it will not be necessary for work to be executed at a loss in order to keep workmen together and to find use for plant. The time must be regarded as favourable for enterprise. During the struggle in Africa the state of feeling abroad has been gauged, and we can now see that competition in trade assumes with some foreign rivals a spirit that is not unlike what is witnessed in times of actual warfare. If England is to hold her own in

the markets of the world it must be through the production of superior or cheaper goods in all varieties, and in accomplishment of that task suitable structures are without influence. Many English factories are a discredit to the country, and it is dubious whether satisfactory work can be turned out in places which are so defective, it has been necessary to pass a special Act in order to prevent them becoming destructive to the operatives employed there.

It is not to England alone that we need now limit our views when we speak of prosperity. Under an honest and skilful Government there is no doubt that South Africa will become a source of profit for many people in this country. It contains most of the elements of wealth, and they will be increased with the aid of British ability. For several years there was a prejudice against English traders and producers, but we can now look to find a less narrow-minded manner of dealing with us.

In Johannesburg, which seems destined to be the business capital of the British Transvaal, the inhabitants have been acting for some months as if the war was over. Those who are best acquainted with the district and population are aware that although there may be an outward aspect of cleanliness, what is known in England as sanitation has been long neglected. A new spirit is now manifesting itself, and it has a regard for public health to which the preceding rulers were indifferent. The Town Council of Johannesburg have, for instance, requested the Colonial Office to instruct the newly appointed town engineer before he leaves England to inspect the various systems of drainage and sewage treatment which are likely to be of use and adopted in the district. The subject is one which is receiving much attention from the local authorities, and temporary measures which are likely to be resorted to are calculated to cost over 114,000%. In order that there may be no delay it is proposed to employ cast-iron pipes instead of stoneware pipes, and it is anticipated when a completed system is carried out it will be possible to sell the pipes for use in other places. Compared with the large works that are undertaken in England the Johannesburg drainage may appear to be of slight account, but the disturbed state of the country should be considered, as well as the lethargy which characterised former legislation in respect of all sanitary questions. England should not allow the contracts to be carried off by foreigners. A wide field is about to be opened for enterprise, and efforts should be made to prevent intrusion from monopolising it.

The future prosperity of Johannesburg is also indicated by the efforts of the Town Council to obtain possession of the tramways. A system which is not altogether perfect was in use before the war. It was owned by a company under a concession from the Boer Government, but has yet to be decided whether the company's rights will be recognised as valid, and for the present the working of the tramways is suspended. As horse-power alone is employed it is proposed to substitute electricity, and there is no doubt that sooner or later the most expedient system of traction will have to be adopted. In Cape Town the value of the electric trams has been doubled, and it is assumed that in Johannesburg profits will be no less in that town. The Town Council with such an enterprise before them have become advocates of municipal tramways. Whether a company of shareholders or the Town Council will control the tramways they will form an excellent property, and will serve as an auxiliary to building in the suburbs.

There are many signs that business is quickly attaining its normal state in Johannesburg. Sites for commercial premises and residences are being offered for sale. Quarries have been reopened and orders are undertaken for preparing stone "from a window-sill to a mansion." Tenders for buildings are invited. Luxuries are available, and one firm announces that they have on sale "the best assortment of Academy pictures." It is not to be expected that architecture will immediately be shown in costly forms. For a time trade necessities may have to be met by unpretentious buildings, but there is wealth beneath the surface of the Rand which it will take long to exhaust, and where there is wealth there is always a likelihood that architecture will be encouraged. The former settlers mainly drew

come from flocks and herds, and the Dutch farmhouses which have been destroyed during the past two years could not be regarded as satisfactory. Under the new régime trade and commerce will have the ascendancy, and will consequently make more demands on the builder than formerly. The Transvaal, in fact, is about to enter on a new era, and it is not unreasonable to anticipate that better buildings will come into favour, and that British materials will be largely used in all public works.

One hopeful sign is that for professional services liberal salaries are paid. A locomotive superintendent on one of the Indian railways has been able to obtain nearly three times his former salary in South Africa. Several surveyors and medical officers of health have resigned their offices in England in order to take advantage of the larger sums which are held out to them in the same region. Ordinary labour also receives more reward, and the prices paid for machinery, appliances and materials should allow good profits to importers. South Africa appears capable to serve the true purposes of a colony as now understood, and by becoming prosperous to aid in the prosperity of the country which it owes allegiance.

## GREEK ILLUSIONS.

By LAWRENCE HARVEY.

HAVE seen Greece. The sight has dissipated fanciful fables and superstitious beliefs with which I have bedazzled all my life.

My father was a Greek scholar of no little merit. He had read HOMER four times in its Greek text. He had made for his private use an Homeric vocabulary written on cards, which he used to carry in his pocket and study in every spare moment. He had engaged the services of three modern Greek masters, one a learned monk escaped from Mount Athos, and he used to speak the old Greek language with the modern Greek accent, and write it in the current Greek hand. No wonder that I was brought up in the veneration of all that was Greek. Greek art was early imprinted out to me as the supreme type of perfection, which portraits of coarser clay like ourselves might by constant study approach, never equal and still less excel.

Another of my beliefs had its origin in the lessons given me by the French Academician, VICTOR HERBULIEZ, whom my father had engaged to instil in me the true principles of art and literature. HERBULIEZ was when a young man, he had lived some time in Greece, and as an enthusiast, had seen all in rosy colours. He told me so to explain Athenian superiority, the climate of Athens is so delightful that he had felt himself mentally transformed while residing there. The light was such that it lent a charm to every object, and Greek art and architecture could not be rightly appreciated if not seen in the place where it is created.

My first teacher in the art of architecture, the celebrated architect, Professor GOTTFRIED SEMPER, used to speak somewhat in the same vein. A crowd of writers in German, French and English all proclaimed the same things in more or less enraptured tones. I now ask myself how much of all this was due to real sentiment, and how much was due to posturing snobbism, eager to travel in the land of accepted intellectualism.

To begin with the descriptions of the extraordinary freshness of the atmosphere in Greece, I beg to say that during a two months' stay I have not found any day brighter than those one can enjoy in Brighton during the summer. In Athens I have even seen some hazy days which reminded me of London. For purity of air and distinctness of vision Athens seems to me decidedly inferior to Geneva, where I am actually residing. It therefore follows that if Greek architecture was beautiful to behold in Greece, it would produce an equally good impression in Brighton and in Geneva.

Has Greek art been also overrated?

I cannot speak of literature, sculpture and painting, which are subjects with which I am only slightly acquainted. I shall limit my appreciations to architecture.

Now that I have seen the Temple of Theseus, which after more than two thousand years seems as fresh as many a

building in London of a few years' standing, and have visited the Acropolis, contemplated and studied what remains of the Propylea, the Erechtheion and the Parthenon, as well as the ruins of Olympia, of Delphi and Corinth, I am able to form an opinion on the merits of Grecian architecture in the Golden Age of Greece.

In my opinion the Greeks of the age of PERICLES fail entirely in two most important parts of architecture. They are weak in construction, and they hardly have an idea of what architectural composition means.

Their edifices are simply timber structures, executed in stone instead of wood. To carry out these structures they have put themselves to great expense for carriage and hoisting. In the Propylea I have measured marble beams 27 feet long, 2 feet 6 inches high and 3 feet wide. In the Erechtheion there are such beams *in situ* carrying the ceiling. Although this is a strange way of using stone, I admit that this system of construction may have been used by the Greeks not through ignorance, but from hieratical motives as part of their religious rules. Where the Greek fails as a constructor is in not carrying out his system properly. He often plans his buildings without taking the construction of the ceiling into account. In consequence one sees beams, the ends of which rest neither on the axis of columns nor in the middle of intervening spaces, but anywhere haphazard. This gives very unsightly results.

The Greeks do not seem to have appreciated the importance of alternating the joints of their stone courses so as to obtain a proper bond. In the ruins of the Temple of Corinth, in the Temple of Theseus at Athens I have ascertained that the builders were not able to find a way of preventing that the joint at the angle of the architrave and the joint of the frieze above fall exactly one over the other. Fig. 1 shows the plan of the architrave

formed of two slabs placed side by side, and fig. 2 is a perspective sketch of the angle of the entablature, showing the vertical joint going through the architrave and the frieze. The solution of this problem is very simple. It consists in forming the metope A and the triglyph B of one piece of stone so that the vertical joint should fall on C; but this obvious constructional device did not occur to the Greek mind.

Worse still remains to be told. The architrave of the Parthenon, the plan of which is sketched in fig. 3, is composed of three slabs set side by side. I cannot say whether it is as faulty in the jointing at the angle as the buildings mentioned before, but I was surprised to see that the triglyphs of the frieze did not form bond stones through the wall as I naturally expected, but only overlapped a little the middle course of the architrave below, forming thereby a very defective bond between the outer and the inner wall. In such an expensive and important building as the Parthenon such defects can only be ascribed to want

of constructional instinct in the builders. True, the Greeks make up for want of bond in their masonry by an extensive use of iron clamps, but that proves little for their intelligence as builders.

To whatever nation they may belong architects agree in considering that architectural composition consists in grouping a quantity of component parts—sometimes independent structures—in one harmonious whole.

I have already shown that the Greek did not in his temples combine the plan so that every part should fall harmoniously together. When passing from the simple arrangement of one temple to the combination of a number of buildings, as seen in the Acropolis, the Greek produces the greatest higgledy-piggledy piece of happy-go-lucky disorder the mind can conceive. Greek architecture shows the same mental phenomena as Greek polity. In politics the Greek conceived nothing beyond the citizenship of his native city. He had some vague ideas of the unity of the Greek race, but he was never able to combine all the cities of Greece in one workable confederation, such as the Swiss Confederation or the United States of America.

If Greek architecture be so defective, whence comes the reputation it has enjoyed throughout ages?

I see two reasons for this: the one lies in the intrinsic merit of some of the Greek works, the other in the fame of Greece in other respects.

The Greek had an exceptionally refined feeling for form, which made him the first of sculptors; that feeling he applied to the very simple structure which forms a temple. He studied therein every question of outline and proportion as he would have done for a statue, and that was sufficient to give to a temple a high artistic value.

People have a tendency to prize everything which belongs to a nation successful in war. When I came over to England after the Franco-German war of 1870 I was surprised to find that the credit enjoyed formerly by French art and French taste had suddenly dropped about 50 per cent. I should not be surprised that the effects of the happily concluded South African war will be felt in the value of English furniture on the Continent. At the time of PERICLES a mere handful of Greeks had successfully repelled the invasion of the most powerful empire of the East; they had practically saved Europe from slavery, and it is no wonder that everything Greek, and especially Athenian, was looked up to with admiration.

The Greeks were, are even now, gifted in speech and writing. They made a very liberal use of their talent in trumpeting the fame of all that was Greek. Hence Greek things have come down to us enshrined in the halo of Greek poetry and Greek rhetoric.

As to the great fame of the Parthenon, I believe it was due to a large extent to the admirable situation of this building. This temple soared in the blue sky above a rock of about 300 feet, and when picked out in colours and gold must have been a most impressive object to contemplate. But as a building, apart from its surroundings, I consider it to have been inferior to the Madeleine in Paris.

To begin with, the Doric cap, even that of the Parthenon, is a defective solution of the problem which every cap contains. A cap is a transitional feature for passing from the round column to the square abacus. The Doric cap does not solve that problem, for it leaves the corners of the abacus unsupported. This feature is all the more unsightly in the Parthenon (see fig. 4) as the architrave is wider than the shaft of the column and really bears on the beetling cap. Everybody knows how admirably the Corinthian cap passes from the round column to the square abacus; this fully justifies the favour it has found everywhere from the time of the Romans to our days. A less fanciful and more

durable cap is obtained by crowning the shaft by inverted cone as in fig. 5, a device adopted in Media architecture.

I remember VIOLLET-LE-DUC accuses the Greeks putting their figure decoration in the wrong place, where cannot be seen. The view of the Parthenon fully substantiates that accusation. The only place where one can enjoy metopes of the Parthenon is the British Museum. In they look so small, and are so indistinct, they are not worth looking at.

Another superstition one gets rid of in Greece is that the beauty of white marble as a building material. This superstition is based on one's reverence for value. It belongs to the same order of beliefs as that of some people for costly medicine. In reality white marble is the ugliest of building materials. In Athens, where it is the freestone available, its principal merit is that of serving as a slate for the boys, who scribble their sums on the wall while going or coming from school. Marble, by its polish and whiteness, dulls every effect of light and shade, and is in effect so objectionable that many people have coloured their marble walls with drab colour in tempera. Such as SCHLIEMANN'S palace amongst others, where the marble appears owing to the rain having washed out the colour. I am now fully convinced that the marble temples of Athens were completely coloured so as not to let the marble appear anywhere. If marble were used it was simply that in other material could beams of 28 feet long be obtained tough enough to carry the weight of ceilings.

A voyage in Greece is instructive by the insight it allows in the beginning of things. At Corinth I have seen people building their houses out of blocks of earth or bricks measuring 14 feet by 7 feet by 5 feet. With such material wood frames are required to form the windows and wood posts to support the floors and roofs. Hence the origin of the frames carved round our windows and pilasters on the walls, which are utterly meaningless on stone walls. The ruins of Mycenæ have shown me even then the inhabitants of Greece constructed their walls with raw bricks. Close to the Lion's Gate there is a large circular hall, the walls of which are indicated by a lower row of slabs 4 feet high and 4 inches thick. The space between the two rows is 3 feet, and the upper parts of

slabs present notches wherein were dovetailed pieces of timber to tie the two rows together (fig. 6). In places the two rows are covered by horizontal slabs, which has been preserved the kernel of the wall in bricks or rammed down earth. Here again we see in the beginnings the construction of the dado or base to protect the earthen wall, an architectural feature which has a practical purpose with stone walls.

Everybody knows through descriptions and drawings the beehive tomb near Mycenæ called the Treasury of Atreus. It is a circular underground dome 50 feet

nd 50 feet high, the vertical section of which is that of a Gothic arch (fig. 7). The work, although dating from at least 200 years B.C., is as fresh as if built yesterday. It has always been described as built of layers of stone beetling outward one over the other so as to produce the surface of the vault. The structure being strictly preserved I cannot say whether this description of its construction be true, but I see great practical inconvenience in constructing in this way the upper courses of the dome. There every ch stone would present a feather edge on its upper joint and an obtuse angle on its lower face; this should inevitably lead to the breaking off of the sharp-edged arrisses of the joints. Near the Treasury of Atreus is another beehive-shaped tomb of similar shape and construction called the Treasury of Clytemnestra. The vault of this tomb is half fallen down, and I picked out of the ruins a perfect arch-stone with top and bottom bed with conical surfaces such as I have had worked hundreds of times in my classes of masonry in London and Geneva when constructing cupolas. We have there the proof that the proper way of constructing cupolas has been known and practised from at least 1,200 B.C. on Grecian soil. If to this fact we add the jewellery which Dr. SCHLIEMANN has found in the graves of Mycenæ, rich in perfection of workmanship and design would carry the palm if compared to the jewellery exposed in the Paris and Geneva shops of to-day, we are forced to admit that the world has progressed very little during the last 3,000 years. Our pride and self-sufficiency comes merely from our ignorance of past ages, and that is the main lesson to be gathered from a trip to Greece.

## RECENT ARCHÆOLOGICAL DISCOVERIES.

At the Manchester Museum, Owens College, on Saturday last, Professor Boyd Dawkins delivered an address on recent archaeological discoveries. He first referred to "the wonderful temple of Stonehenge." One of the large stones in the great circle of Stonehenge tumbled down about a year ago, he said, and in the excavations which were made in the course of putting it up a considerable number of implements had been found. These were described in the newspapers, and for the most part described wrongly. We had, however, nothing in the discoveries which added to our knowledge of the date of Stonehenge. It was built by the people who used bronze implements and weapons. Stonehenge might be looked upon as the Westminster Abbey of the Bronze period, and the smaller and less important stone circles, to be found far and wide in the British Isles, as parish churches, chapels-of-ease and the like. He turned to a discovery he had the good fortune to make some two years ago, and which he had recently brought before the Archaeological Institute, consisting of a number of iron and bronze articles, to be seen by those present. Some of these articles were of iron, and others of iron coated with bronze. There were axes, adzes, hammers, chisels and gouges; there were sickles and billhooks, and spears and dagger or spear-head. The bronze things were mostly snaffle-bits or pieces of them. All the bits of the prehistoric age were made of iron, or iron coated with bronze, and they were all of the snaffle kind. The collection illustrated the life of the prehistoric inhabitants in Kent at a place near Canterbury. The most singular things found there, and nowhere else in this country as far as he knew, were shackles or collars, probably for horses. He said probably, because for he knew they might have been put round the ankles of prisoners or slaves. They were very well made, and along with them was a chain upwards of 20 feet in length, with a number of circular iron bars. All the implements were found together in an old encampment, and this represented the site of Canterbury in the prehistoric Iron Age, before the Romans were here. It also fixed the date of one of the important roads in the South of England called "The Pilgrims' Way," leading from Canterbury along the downs westward into Wiltshire and beyond. It acquired this name because the pilgrims to St. Thomas's shrine were in the custom of taking that line. We now knew from these remains that it belonged to the prehistoric Iron Age, and might be looked upon as one of a network of narrow roads that ran from one centre of population to another, that spread nearly all over this country, and that were in some parts, as in the case of the Pilgrims' Way, still used. It represented, as far as he knew, one of the best roads intended for the use of wheeled vehicles. In conclusion, Professor Dawkins described the important discoveries of Dr. Arthur Evans in Crete. "These now allowed us, he said, to form a comparatively clear idea of the wonderful civilisation which existed in the Mediterranean region long before the

name of Greek was known, and from which their civilisation and their manifestations of art, as in sculpture, were derived by the Greeks.

## THE ASSOCIATION IN ARCTIA.

THE poets of the Architectural Association have laid so many lands under contribution, it has been necessary this year to go far north to Arctia, a region which is unknown to most of the world, but exists somewhere, as William Morris says, "Betwixt the ice hills and the cold grey sea." It is ruled by a King of democratic tendencies, who in his turn is under the tyrannous sway of a Queen whose mind cannot soar above the practical commonplaces of life. They have one fair daughter, the last of the royal race of the Icebergs, and the difficulty of the hour is to discover a spouse worthy of her Highness, for there is not "a single eligible Duke or even a Coronation Knight to be found in the length and breadth of the land." The royal matron has decided to bestow her daughter's hand on old Vinolia, the Architect-in-Chief, as the most desirable *parti* in Arctia. He has one quality to recommend him—his freedom from conscience. The Princess is aghast at the thought of marrying a common architect, but she is informed that Vinolia is a most uncommon architect, for he is successful. How he has gained success he describes in song:—

You may talk of architects,  
And their merits and defects,  
Of their powers of construction and design;  
But such trifles do not matter,  
You ignore them and grow fatter  
In a little State monopoly like mine.  
If a tower should collapse,  
Then you hang the builder chaps,  
While exhibiting a little decent grief;  
If a town hall look unsightly  
You behead your staff politely—  
It's your duty as the Architect-in-Chief.

Yes, a modest execution  
Is the speediest solution,  
And affords me inexpressible relief,  
His Majesty's most venerated,  
Adulated, imprecated,  
Underrated Architect-in-Chief.

In the days of competition  
It was made the first condition  
That the Architect-in-Chief was to assess,  
With absolute discretion,  
To announce in due succession  
Each competitor in order of success.  
But I found out to my pain  
Plans would often cheques contain,  
Or a bank-note of a value past belief;  
So in order to checkmate them  
I resolved to confiscate them—  
'Twas my duty as the Architect-in-Chief.

Yes, in cases of commission  
In a public competition  
You must set an architect to catch a thief,  
Like His Majesty's most implicated,  
Irritated, aggravated,  
Antiquated Architect-in-Chief.

So I undertook a mission  
To abolish competition,  
For I saw that architectural design  
To be executed properly  
Should be a State monopoly,  
And now that snug monopoly is mine.  
I've built temples by the score,  
And of town halls even more,  
But my list of working drawings is quite brief;  
They are wholesale and not retail,  
For I use the same old detail—  
That's the beauty of an Architect-in-Chief.

Yes, I'm P.R.I.B.A.,  
And I'm boss of the A.A.  
And of titles I've a modest little sheaf;  
I'm His Majesty's unvaccinated,  
Second-rated, silver-plated,  
Addle-pated Architect-in-Chief.

The King's objection to the union is that he has made a solemn vow to give his daughter in exchange for the Pole, or, in other words, she will become the prize of the discoverer of that important position, which is more interesting to the people of Arctia than to other races. Opportunely a band of Vikings under the command of Beowulf, arrive in an airship. They had

heard of a green land beyond the mountains, and had sworn to find it. The vessel is known as the "Exseltzor," an appropriate name, as the inspiration for it came through the medium of a soda-water bottle. It was only courtesy to show the strangers the architectural beauties of Arctia, and Vinolia, as in duty bound, offers to point out the famous sights of the city, as well as the building sites. Sigurd, a prince, is not delighted when afterwards the Princess informs him that the Architect-in-Chief is to be her future husband unless some one discovers the Pole, and he resolves to seek it regardless of the dangers. All the Princess can tell him about the Pole is that she possesses a magic wand, or divining-rod, which in right hands will lead to success. It bears the following inscription:—

True steel am I, and made for hearts of steel,  
Hearts that can brave the turn of Fortune's wheel.  
If such an one shall bear me to my goal  
I'll stand upright upon the Northern Pole.

It is needless to say that Sigurd sets out upon his quest confident of the result. The Queen and the Architect-in-Chief are not satisfied with what has taken place. Her Majesty asks her intended son-in-law whether he is learned in the law, and he replies he knows a little about the Building Act, especially the part relating to surveyors' fees. The Queen would have preferred that he was acquainted with another metropolitan enactment, the Alien Immigrants Act, and suggests that if one does not exist he might try and create a substitute. The moral representative of the mother of the arts consoles himself with the thought that after all one does not need to be very bad to perform forgeries nowadays, since that is left to the "Goudie-goudies." At length the worthy pair profess to have brought to light an ancient law which applies to strangers who visit Arctia for the first time, and which is thus expressed:—

If ever by some superhuman skill  
A stranger, be he well-disposed or ill,  
Succeed in passing the impassable,  
And set his foot upon our native soil,  
Not for another day shall he draw breath,  
But pay for his audacity with death.

As Sigurd is away Pole-hunting the letter of the law cannot be immediately enforced. There is no sign of his returning from his exploration, so the marriage of the Princess with the Architect-in-Chief appears to be inevitable. With an architect marrying into the royal family it is time to take notice of the art that was honoured in its representative, and accordingly the King determines to found a College of Architecture. This gives an opportunity for conversation about the profession. One courtier defines an architect as a man who is expected to know every other man's trade or profession better than they do themselves. He also says he has heard the architect leads the life of a hunted hare; that he is never known to smile, because he has not any time; for the same reason he never takes exercise and also never goes to bed. He draws details all day long with both hands; writes specifications with his feet, and dictates letters while at lunch. Thereupon all join in pitying the poor architect:—

A was an Architect, old in his prime.  
Pity the architect.  
B was a Builder, who took his own time.  
Pity the architect.  
C was a Client who had his own views,  
D was the Details that no one would use,  
E the Erection he tried to excuse.  
Oh, pity the architect.

Oh, pity the architect,  
On his trials and troubles reflect,  
Sing his story pathetic,  
O Muse alphabetic,  
And pity the architect.

F was the Frontage exceedingly tight.  
Pity the architect.  
G was the Ground Plan exceeding the site,  
Pity the architect.  
H the Half-timber he had to reveal,  
I was the Ironwork he had to conceal,  
J was the Joinery, mostly of deal.  
Oh, pity the architect.  
Oh, pity the architect, &c., &c.

K was the King-post that ought to have stood.  
Pity the architect.  
L the stone Lintel that proved to be wood.  
Pity the architect.  
M was the Mullion that blocked out the light,  
N was the Newel too thin for its height,  
O the Oak sill that was not water-tight.  
Oh, pity the architect.  
Oh, pity the architect, &c., &c.

P was the Price on the contract agreed.  
Pity the architect.  
Q was the Quantities down to a bead.  
Pity the architect.  
R was the Rage that the client displayed,  
And S the Sarcastic remarks that he made,  
When T was the Total that had to be paid.  
Oh, pity the architect.  
Oh, pity the architect, &c., &c.

U was the Umpire called in to decide.  
Pity the architect.  
V was the Value the client denied.  
Pity the architect.  
W stands for the Words that he said,  
X was the Xtras for which he was bled,  
Y Z the Young Zealot who wished he was dead.  
Oh, pity the architect.

Oh, pity the architect,  
On his trials and troubles reflect,  
Sing his story pathetic,  
O Muse alphabetic,  
And pity the architect.

The King afterwards explains the process of thinking which his Architectural College was arrived at. At first intended to give his Architect-in-Chief a nasty fall; a confession of royal ingratitude. Then he thought it was politic to have only one man to design all the vast buildings which were being raised daily, and he came to the conclusion there must be a nursery to foster the growth of budding architects; a university to cram and stuff and turn them out blown geniuses like a sausage machine—a confusion of figures worthy of royalty. The Architect-in-Chief preferred they should all become his pupils, but His Majesty recognised the evils of the pupilage system from his own experience, and at last the Royal College of Architecture or Home for Lost Pupils evolved. The royal invitation to candidates was conveyed in the following song:—

Come hither, pups of every breed, and listen to my lecture  
On the trials and the troubles and the joys of Architecture;  
On the uses and abuses of the set-square and the sector,  
And the ink, puppy, ink, ink, ink.  
Come hither, pups, with lengthy hair and Arty-coloured ties,  
And pups with massive foreheads looking infinitely wise,  
And pups with scrubby, chubby cheeks, and pups with laughing  
And drink, puppies, drink, drink, drink.

Drink, puppy, drink,  
Let every puppy drink  
From the free-flowing fountain of knowledge.  
You shall learn your little duty  
To build in Truth and Beauty  
At the Royal Architectural College.

You shall learn to treat the office as a sort of social club,  
You'll come late and you'll go early, and you'll take two hours  
grub;  
And in summer you'll occasionally slip out to the—A B C,  
For a drink, puppy, drink, drink, drink.  
With a tee-square as a bat, and with the fireplace as a wicket,  
And the office duster as a ball you'll play at office cricket;  
When you hear the well-known footsteps in your pocket you  
stick it,

With a wink, puppy, wink, wink, wink.  
Drink, puppy, drink, &c.

You shall learn on every building to express your youthful views;  
You shall make some full-size details far too wonderful to use,  
Or trace a drainage block-plan which you'll paint in brilliant hues,  
Blue and pink, puppy, pink, pink, pink.  
And in time it is just possible, though not beyond a doubt,  
With care and with attention in three years or thereabout,  
You will suddenly discover you're beginning to find out  
How to think, puppy, think, think, think.

Sigurd returns and has to confess his failure to reach North Pole. The Princess consoles him by modestly proposing they shall elope in the airship, but as he declines to leave his companions an alternative is suggested, which is that he shall meet the Princess at sunset in the High Priest's mansion

ere get married. The Architect-in-Chief overhears the plot, and although he feels he ought to say, "Bless you, my children, I shall be very happy to be your best man, and what sort of wedding would you like in the way of a tea-service?" yet he cannot, for the not having the faintest idea of how he ought to act has been one of the misfortunes of his career. All his plotting and schemes come to an end, for although Sigurd is unable to find the Pole the divining-rod serves as a substitute, and he and the Princess are happy. It is the old story, Harlequin—Sigurd, wins Columbine—Hilda, despite the machinations of the Queen—Vinolia; and Pantaloon—King, can exclaim, "Here at last is an end to all my anxiety."

The play was pleasantly written, and the skilful treatment of an exacting subject does credit to Mr. Gervaise Bailey's skill. That Mr. Leonard Butler's music has not declined in melodiousness through his increased experience as a composer is proved by the general admiration of the songs. Mrs. Stalman and Miss Cray, Messrs. Carvill, Bentham, Preston, Dare Clapham and Baker acted efficiently, and the evening was an enjoyable one for the members of the Association and their friends.

#### *Dramatis Personæ.*

Dolph, King of Arctia	Mr. G. B. CARVILL.
Queen of Arctia	Mrs. STALMAN.
Prime Minister	Mr. A. W. BENTHAM.
Architect-in-Chief	Mr. GEORGE PRESTON.
Rowulf { In command of Viking Exploring Expedition	Mr. F. DARE CLAPHAM.
Sigurd, Son of Seawolf, King of Fjordland	Mr. DALTON BAKER.
Line { Ladies-in-Waiting	Miss SOPHIE TYLER.
Yola {	Miss ADA YERBURY.
Ever Stick-in-Waiting	Mr. ALEC SMITHERS.
Old Stick-in-Waiting	Mr. GERVASE BAILEY.
and	
Princess Hilda { Daughter of the King and Queen of Arctia	Miss EMMIE CRAY.

*Ladies and Gentlemen of the Court, Pages and Vikings.*—Edith Byrne, Jessie Carvill, Nellie Carvill, Florence Lyton, Gwendoline Low, Mary Seaman, Mabel Smithers, E. Turner, Lulu Tyler. Messrs. R. F. Arkwright, Fred Judfield, Percy Crockett, T. Fraser, Eustace Harrington, Harrison Hill, A. C. Kelly, A. W. Smith, T. S. Taylor, G. Turner, Leslie Ward, Duncan Williams.

#### BIRMINGHAM ARCHÆOLOGICAL SOCIETY.

THE first excursion of the Society for the present season was held on Saturday, when Tong and Shifnal were visited. A very pleasant drive from Shifnal brought the party to Tong, where the church was carefully examined under the leadership of the Rev. J. G. Auden. The date of the church is known to be the first decade of the fifteenth century, and the whole edifice is a striking example of unity in design, the earlier building having completely disappeared, while no material additions have been made to that now standing, and restoration has been prudent and merciful. The most striking feature is the octagonal central tower, an almost unique temple for its age. The historical glory of Tong lies in its noble series of monuments to the Vernon family, but there is also a literary interest of no small value, arising from the fact that it was here that Dickens imagined the last rest of Little Nell. The Gilden Chapel, though small, is a really exquisite temple of lavish decoration, and there are valuable remains of ancient glass. After visiting the church the party, by the kind permission of Mrs. Hartley, drove through the park and inspected Big Castle, perched on a high mound, surrounded by a remarkably deep moat, which in its present dry state is spectically a ravine. The castle itself is an eighteenth-century erection in a style which would now merit no commendation, but it is as pleasing an example of its style as could probably be found. Returning to Shifnal, and after an excellent tea at the Birmingham Arms hotel, Shifnal Church was visited. The Rev. J. Cavis-Brown carefully explained all the details of this most interesting building. Large portions of the church are Norman, and remains of the earlier edifice are to be found in most unexpected places. The tower, for example, is Early English, but it would seem to have been built inside the older Norman tower, of which one fine arch is left intact. A beautiful Norman entrance has been built up, and a buttress stands right across the centre; but the carved capitals and columns seem to have appealed to the innovator, and are left receding into the wall in the most singular manner.

There is a parvise or church meeting-room, but instead of being built over the porch, as is usual, it is boldly projected into the church itself and supported on arches. The general appearance of the interior of the church, while simple, is of great dignity, and although restoration has in the past been too lavish, the utmost care is now taken to preserve all details of interest. In the glebe land are two well-preserved British camps or sites of fortified villages.

#### SHROPSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Shropshire Archæological and Natural History Society was held in the Music Hall Buildings, Shrewsbury, on Friday afternoon, when the Right Rev. Bishop Allen presided.

The Rev. T. Auden, chairman of the Council, read the report, which was as follows:—

The past year may be regarded in several respects with satisfaction. The accounts show a more favourable balance than has been the case for many years, and it is matter of congratulation that this has arisen partly from the number of new members who have joined the Society during the year. On the other hand, however, the Society has to lament an unusual number of deaths. Mr. James Cock, Mr. T. Thornes, Mr. F. R. B. Walton, Mr. John Corbett, of Droitwich, Mr. Humphrey Sandford and Mr. Stanley Leighton have all passed away. Of these Mr. Sandford had occupied an important position in connection both with the borough of Shrewsbury and the county for an unusual number of years, and during the whole of his long life had taken a warm interest in their past history. The greatest loss, however, not only to this Society, but to archæology generally, has been the death of Mr. Stanley Leighton, who had filled the office of vice-president from its foundation, and had frequently made valuable contributions to the pages of the "Transactions." In the words of a resolution unanimously passed by the Council when his death occurred, "In spite of absorbing interests in other directions he had attained the foremost rank among the antiquaries of Shropshire, and his lamented death leaves a void in this as in other respects which it will be very difficult to fill." It will be seen from the accounts that the Council have had to spend a considerable sum in the repair of the fences at Uriconium, which had become dilapidated. They had hoped it would have been possible this year to renew the systematic exploration of the site, but after correspondence with Lord Barnard and the Society of Antiquaries they have been forced to the conclusion that the matter must wait a while longer. Excavations at Wenlock Priory have revealed the foundations of at least one earlier church on the same site, and traces of a lake dwelling have been discovered near Ellesmere. It is hoped that further investigation will, in each of these cases, lead to important results. The "Transactions" have maintained their interest. A new feature has been introduced in the form of an index to each volume as it is completed; it is hoped that this will materially add to their usefulness for purposes of reference. The forthcoming volume will contain the first instalment of an account of the bells of the county, from the pen of Mr. H. B. Walters, F.S.A., of the British Museum, who has devoted himself to the subject for several years past. One other topic may be alluded to, though the event is at present comparatively distant. Next year is the 500th anniversary of the battle of Shrewsbury. The Council venture to hope that when the time draws nearer the inhabitants of Shrewsbury and the county will be ready to join in a suitable commemoration of that important and interesting historical event.

The Court of Aldermen will erect on the occasion of the Royal processions of June 27 and July 3 next strong barriers, 4 feet high, at an expense of 3,843<sup>7</sup>/<sub>8</sub>, across all streets and public footways abutting on the route within the City from Temple Bar to London Bridge.

A Meeting of the Garden City Association was held at the Holborn Restaurant on Monday, when a letter was read from Messrs. Emerson & Co. giving an account of the garden city that is to be built between Hull and Haddon, consisting of 14,000 houses with a garden to each, at a cost of 420,000<sup>7</sup>/<sub>8</sub>. This will take four years to complete. The Association will hold a conference at Port Sunlight on July 12.

London Bridge will be decorated for the Coronation festivities. On both parapets of the bridge will be placed alternate columns and masts, the columns being of a height of 30 feet and the masts 12 feet. Each column will be connected by floral festoons and surmounted by an Imperial crown of suitable proportions. The masts bear a gilded British lion rampant, and each carries a trophy of arms, floral festoons linking up each mast, while the columns will be connected by rosettes of red and white—the Corporation colours.

### NOTES AND COMMENTS.

THE excavations at Silchester during last year have had some unusually interesting results. The site, it will be remembered, has been divided into insulae which are mostly squares. One house in Insula XXVII. was evidently enlarged as if to accommodate a greater number of occupants. As far as can be judged from the plan the additions were not all laid out at right angles. One room was circular. Another peculiarity was the combination of wattlework and plaster, from which it has been inferred that the Roman builders were acquainted with what is now known as half-timber work; examples, which are similar to what is seen in Silchester, have been found in many parts of the Continent. In one room several jars were found which were fitted into holes in the floor. Both Greek and Roman builders were accustomed to use pottery in construction, although the purposes served by pots and jars is not always evident. In Silchester it is thought that they may have served to support props or perches for birds. The remains are now on view in the rooms of the Society of Antiquaries, where they can be seen until Tuesday next. The excavations have been in progress during twelve years. It is contemplated in the next season to open the area adjoining the churchyard of Silchester. The exploration is conducted with much care and is deserving of public support.

It is remarkable how quickly the reputation of some French painters passes away, and as a kind of compensation some of those who were forgotten appear to excite renewed interest, as it were, by accident. At the present time LOUIS LEOPOLD BOILLY is the most remarkable of the revivals. He was born as far back as 1761, and died in Paris in 1845. It has now been discovered that his pictures are invaluable as illustrations of events which he witnessed, and are therefore truthful materials which the historian can utilise. The prices given for his pictures in the Lutz sale in Paris last week were unusual. His *Distribution of Wine and Food in the Champs-Élysées* in 1822 was sold for 30,000 frs.; *A Gratuitous Representation at the Ambigu-Comique* realised 28,500; his *Little Savoyards*, 27,000; his *Cabaret*, 11,500. The largest price, however, which was attained by a picture was given for the *Lac de Garde* of COROT, the amount being 231,000 frs. The whole collection was paid for liberally, the total amounting to 1,811,565 frs. It may be mentioned that two of BOILLY's works are in the Guildhall exhibition, which are examples of the fine finish which he sought and was able to attain.

OWNERS of property along the line of the Central London Railway have complained that they were unable to obtain compensation for the inconvenience suffered through vibration. The experts who investigated the subject have testified that no real damage can be traced, but in connection with railways the mere suspicion of damage is supposed to be a sufficient cause for an action. In connection with the "Tube Railway Bills" which are now before Parliament, it has been decided to introduce a clause by which owners, lessees and occupiers of any land, house or building which shall be injuriously affected by reason of the working of the railway can claim compensation. Lord WINDSOR, who was chairman, has had an onerous task; he has stated that the intention was to make the new clause applicable only to that part of a metropolitan underground railway which is constructed in tunnel and not to the continuation of the line in open cuttings. Claims will have to be lodged within two years, and the amount of compensation can, if necessary, be determined under the provisions of the Arbitration Act.

### ILLUSTRATIONS.

#### WESTMINSTER CITY HALL.

THE extensive alterations and additions which have been carried out to the old St. Martin's Town Hall to transform it into the new Westminster City Hall, which was opened by H.R.H. the Duke of CAMBRIDGE, K.G., on May 29, consists of removing all the old roofs; pulling-

down the two old staircases; removing one of the entrances; constructing new and larger staircase in central position, with an electric lift to run up the whole of same; lowering the walls of one end of the public hall and forming a new council chamber, which is lighted from the ceiling, panelled in oak and decorated in the Renaissance style; constructing two new storeys on the other or front end of public hall, containing on the first floor ante-room to the council chamber, members' room, committee-room and mayor's parlour, and on the second floor large office for the finance department, &c.; rebuilding the west wing from the upper part of ground-floor storey where two old storeys existed, and building three new storeys in the same height as the two former ones, making the floors of the whole building level throughout; constructing, supporting and building a new top or third storey throughout the front portion of the whole building; constructing new roofs over the whole building; remodeling the front elevation and carrying the horizontal lines of the architecture level throughout the full length of the building; arranging and constructing new offices in the basement. The drainage of the building has been entirely renewed.

The dampness of the plaster prevented the building from being completely decorated now, which can be done, however, later, when the building is fit to receive it.

The hot-water and heating is entirely new throughout the building being heated with hot-water pipes and radiators on the low-pressure system, executed by Messrs. Z. D. BERRY & SONS.

The electric wiring throughout and the new fittings have been executed by Messrs. SLATTER & GOATCH. The new ironmongery has been supplied by Messrs. CHARLES SMITH, SONS & CO., LTD.; the marblework staircase, which is Grecian Skyros and Derbyshire alabaster, has been executed by Messrs. FARMER & BRINDLEY; the artificial stone staircase is by Messrs. B. WARD & CO., LTD.; the wrought-iron railing to staircase is by Messrs. HARMAN, POWELL & CO., and the lifts are by Messrs. WAYCOCK & CO.

The furniture in the council chamber has been supplied by Messrs. MAPLE & CO.

The general contractors for the whole of the works are Messrs. PATMAN & FOTHERINGHAM, LTD., who have carried it all out to the designs and under the personal direction and superintendence of the architect, Mr. JOHN MURRAY, F.R.I.B.A.

#### HOTEL DE VILLE, LA ROCHELLE.

THE town of La Rochelle (MACAULAY'S "Proud City of the Waters") should have especial interest to English visitors. It was part of the marriage portion of the wife of HENRY II. The French captured it in 1224, but in 1360 it again came under English sway, and possession was held of it for twelve years. When it became Huguenot capital two centuries afterwards English aid was invoked. Readers of "The Three Musketeers" are aware of the importance which La Rochelle attained in the time of Louis XIII. CHARLES I. sent two expeditions to the relief of the last stronghold of Calvinism in France. BUCKINGHAM was the commander, but he had not capacity for the task, and as a consequence he was assassinated. The gloomy JOHN FELTON. RICHELIEU wished to gain military renown and undertook the siege. The Rochellois were able to hold out for thirteen months before they were rendered. The population was reduced through suffering from 27,000 to 5,000. The Hôtel de Ville was headquarters of the Huguenots. It will be seen from the illustration that the building belongs to the time of FRANCIS I., when the masons were frequently capable sculptors. Unless in terra-cotta, it would be difficult to have so much ornamental work executed in our time, except at a price which would be prohibitive to a French English municipality. The Hôtel de Ville is one of the buildings in charge of the Historic Monuments Commission, and was restored under the direction of M. LISCH.

## THE SHELDONIAN THEATRE, OXFORD.

AN interesting work has been completed in Oxford, for the paintings of the ceiling of the Sheldonian Theatre, the first building erected by Wren, are now restored. The care which has been taken in the operations will be evident from the rejoined reports, for which we are indebted to the Rev. principal of St. Edmund Hall:—

*Report of the Curators on the Ceiling Paintings of the Sheldonian Theatre for the Year 1898.*

The attention of the curators has been directed to the condition of the ceiling paintings. Not only is the covering varnish much discoloured and deteriorated, but in several of the pictures the canvas is split, the paint is in danger of coming away (though as yet it has not done so to any serious extent), and in places there is damage by wet which must at some time have come through the floor above. The curators have consulted Professor Church, who has most kindly and generously given them the benefit of his great experience and scientific knowledge. He has made a careful examination of such portions of the ceiling as could be reached from a temporary scaffolding.

He reports that besides the actual damage which they have sustained, the paintings are very much disfigured by the present state of the varnish. Its remains are so irregular in distribution that both the draughtsmanship of the figures, and the original colour-scheme of the work, notably in the sky and clouds, are very much obscured.

His advice is that steps should be taken as soon as possible to arrest further mischief, and also to restore something of the original effect of the pictures by the renewal of the varnish. The question is one that demands very serious consideration, for whenever any such work may be undertaken, the cost of it would necessarily be large and its execution would need to be carried out with the greatest possible care and skill. It was hoped that the stretchers on which the canvas is fixed might be got at from above, and each panel taken out and dealt with separately, but the removal of a few boards from the floor above showed this to be quite impossible. The work can only be effected on each panel *in situ* from below by the help of scaffolding. Happily, owing to the generosity and forethought of Dr. Wills, warden of Wadham College and curator of the theatre early in the present century, the curators are provided with a fund for meeting an emergency of this kind.

In 1805 Dr. Wills bequeathed to the University 2,000*l.*, the interest to be appropriated first to the "payment of whatever debt may be due to the University from the curators of the theatre for monies borrowed by them of the University on account of the late great repairs done to the said theatre, which debt being fully discharged, . . . one moiety of the said dividends and interest to be annually laid out in purchasing other stock, and to be suffered to accumulate for the future benefit of the theatre" (the other moiety to be paid to the delegates of the Press, Learned Side). In 1826, the debt to the University having been discharged, the moiety belonging to the theatre was invested in 3 per cent. Consols, as the "Wills Accumulated Fund," and this has since been allowed to accumulate; except that recourse has been had to it once or twice for sums comparatively unimportant in amount to meet some special outlay. The curators do not propose under any circumstances to undertake any expense which will involve a charge upon the general funds of the University.

It is perhaps not generally known that Archbishop Sheldon, besides munificently providing the whole cost of the construction of the theatre,\* gave 2,000*l.* "to buy lands . . . to keep it in repair." The income received from this source, together with that from savings invested from time to time, is still applied to the ordinary repairs and current expenses of the theatre, for which they have generally been found sufficient, while the accumulated fund of Dr. Wills provides a reserve out of which extraordinary expenses can be met.

Having had occasion to investigate the history of the ceiling paintings, the curators think it may be interesting to put on record such information as they have been able to obtain, especially as the minute books of the curators before 1872 (if any) seem unfortunately to have disappeared. The following facts are taken chiefly from Walpole's "Anecdotes of Painting in England," s.v. "Robert Streater" (1624-80), supplemented

(as will be seen) by references to the University accounts now in the archives. These paintings are acknowledged to be Robert Streater's most important work, and they were finished about 1669, or soon after, as they were seen approaching completion in that year by Pepys.\*

Contemporary opinion as to the merits of Streater as an artist, and of this work in particular, varied very much. Walpole's own judgment is that "the theatre at Oxford, his principal performance, is a very mean one." One writer, however, quoted by Walpole, *l.c.* describes him as the greatest and most universal painter that England ever bred. Others expressed similarly exaggerated opinions, all however being surpassed by one Robert Whitehall, author of "Urania," or "a description of the painting at the top of the theatre at Oxford," which ends thus:—

That future ages must confess they owe  
To Streater more than Michel Angelo.

These paintings appear to have been already repaired or restored on three several occasions, viz. in 1762, in 1802 and in 1826.

In a note appended to this edition of Walpole it is stated that this painting was first restored in 1762 by Penny, the professor of painting in the Royal Academy, after "it had been exposed to the corrosion of the air for a century," and Walpole saw it before that restoration. This no doubt explains the item in the University accounts for 1762:—"Mr. Kettle's bill for painting, gilding, lining, &c., 373*l.* 16*s.*"

The note proceeds:—"In 1802 the roof of the theatre, being in a state of decay, was then replaced by one, externally extremely dissimilar. The whole ceiling was taken down and effectually restored by Mr. De la Motte, a distinguished pupil of the late Mr. West, by a method and upon a system suggested and always practised by that eminent painter. What is now seen has not been painted on, so that Streater's work remains as he left it, which is no inconsiderable advantage to the artist's fame."

This explains the large expenditure, amounting to about 3,000*l.*, on "a new roof to the theatre" which appears in the University accounts in different entries from 1803 to 1805. The structure of the original roof was designed by Sir Christopher Wren. A full description of his highly ingenious plan will be found in Elmes's "Memoirs of Sir C. Wren" (pp. 518, 519), and also in Plot's "Natural History of Oxfordshire,"† which latter work contains besides a very full and minute description of the ceiling paintings (c. ix. sections 154-163). An alarm was raised as early as 1720 as to the dangerous condition of the roof, which Elmes characterises as a "groundless rumour," contrived "to annoy Sir Christopher Wren in his declining age" (he was then eighty-eight). The Vice-Chancellor in consequence procured a certificate of the sound condition of the roof, a curious document which is preserved by Elmes (*op. cit.* p. 517). The document is signed by one mason and two carpenters of the city of Oxford, and certifies that the "whole fabric of the said theatre is like to remain and continue in such good repair and condition (as at present) for one hundred or two hundred years yet to come."

In 1802 Wren's roof was entirely removed, the statement (as given above) being that it was "in a state of decay." It would be interesting to know on whose authority this statement was made, and under whose direction or advice the curators acted in undertaking such a serious responsibility. No record can be found of this. The expression "externally extremely dissimilar" might seem to suggest that some of the internal features of Wren's construction of the timbers may have been reproduced.‡ No doubt the elaborate descriptions preserved of that design would enable experts to determine this question. The completeness of the external alterations can be seen at once by referring to Loggan's print, to the frontispiece of the Oxford Almanacs for 1774 or 1800, or to the picture on the title-pages of early books printed at the

\* In the notes to Walpole, *op. cit.* ii. p. 434, ed. 1849, the following extract is given from Pepys's *Diary*, an. 1669:—"Went to Mr. Streater, the famous history-painter, where I found Dr. Wren (Sir Christopher) and other virtuosos looking upon the paintings he is making for the new theatre at Oxford, and indeed they look as if they would be very fine, and the rest (meaning the connoisseurs then present) think them better done than those of Rubens at Whitehall, but I do not fully think so. But they will certainly be very noble, and I am mightily pleased to have the fortune to see this man and his work, which is very famous, and he is a very civil little man, and lame, but lives very handsomely."

† The original of both of these plans seems to be that (which is also on a much larger scale) given by Stephen Wren, grandson of Sir Christopher, in his *Parentalia*, pp. 324, 325.

‡ Mr. G. V. Cox (Esquire Bedel from 1815 to 1866), in his *Recollections of Oxford*, says, "I know not whether the old roof was as scientifically constructed as that which replaced it, but the interior of it in its restored state is well worth inspection and is easily accessible."

\* This is estimated by Stephen Wren (*Parentalia*, p. 336) at more than 16,000*l.*; but John Evelyn, who was present at the opening of the theatre, says that Sir Christopher Wren himself told him that the cost had been 25,000*l.* (Elmes, *op. cit.* p. 270). Evelyn further states that the opening ceremony lasted from eleven in the morning till seven at night. "Besides a long speech from Dr. South, the University's orator . . . there were divers panegyric speeches both in prose and verse, interchangeable, pronounced by the young scholars, placed in the rostrums . . . mingled with excellent music, vocal and instrumental, to entertain the ladies and the rest of the company."

Clarendon Press.\*—The old roof was surrounded by a series of large oval dormer windows,† each surmounted by an archiepiscopal mitre.

The following personal recollections of the alterations then made both in regard to the roof and the painted ceiling by Mr. G. V. Cox are specially interesting, as there appears to be no other definite record existing of the work which was actually done.

In Cox's "Recollections of Oxford," p. 46, under the year 1801, we read:—

"The grand ceremony of the *Encaenia* was held this year in the Radcliffe Library—the Sheldonian Theatre being not only under repair, but actually and completely unroofed. A notion had got into people's heads that the roof (at that time one of the largest unsupported roofs in the kingdom) was in an unsafe state; and builders and architects advised not merely an examination, but even the removal of the roof. The thing, however formidable in idea, was safely done. The allegorical painting which covers the ceiling was carefully peeled off; so carefully and successfully, that on its being replaced no mark of injury was discernible—as, indeed, its present perfect condition shows. The striking effect on entering the building when entirely open to the sky could be compared to nothing but to that of an ancient amphitheatre, so that, when the work of reconstruction began to exclude the blue sky, it excited a feeling of regret for the loss of an effect never again to be enjoyed. On the plea of lightening the roof of the theatre, the circular windows (richly ornamented and partly gilded, which, to the number of ten or twelve, relieved and all but concealed the old roof) were unscrupulously removed, on the substitution of the new roof. Without pretending to architectural knowledge, I confess my eye still regrets the old ornamental roof, and is hurt by the entire exposure of the new one. The old cupola or lantern was (in the judgment of many) more elegant, with streaming gilt flambeau, and more centrally placed than its larger and more conspicuous successor."

The following is the item in the University accounts in 1803 for the work then done upon the pictures:—

"Mr. Wm. De la Motte for cleaning and repairing the pictures of the Theatre Ceiling, 100*l*."

The smallness of this amount is probably due to the cost of removing and replacing the ceiling having been included in that of renewing the roof, the actual work upon the pictures themselves being thus rendered comparatively simple.

Finally, in 1826 a third restoration of some kind was carried out, of the details of which no record can be found except an item of 70*5**l*. to "Dixon, decorative painter," in the theatre accounts for that year. Such a large sum can scarcely refer to anything but the ceiling paintings.

These paintings have a special value and interest as being part of Wren's original design for the theatre,‡ no doubt having been ordered and paid for by Archbishop Sheldon himself,§ and they were certainly there when the theatre was inaugurated on July 9, 1669. The design is thus explained by Stephen Wren, "*Parentalia*," p. 336:—"In imitation of the theatres of the ancient Greeks and Romans, which were too large to be covered with lead or tile, this by the painting of the flat roof within is represented open." (Compare the account (*supra*) of the effect of the unroofing in 1802 as described by Mr. G. V. Cox.)

The curators hope that, acting under the best advice attainable, they may be able to adopt means by which the progress of any further injury to this very interesting work may be effectually prevented. They also hope that besides this the removal of the inevitable decayed varnish may, as Professor Church anticipates, "brighten and enrich the ceiling to an unexpected degree," and that at least the effect produced by the painted ceiling may again more nearly resemble that which was intended, and no doubt produced, by the original artist.

#### Report for 1901.

The curators are glad to be able to report the completion of the restoration of the ceiling pictures under the advice and direction of Professor Church. They wish to express once more their obligation to him for the help which he has most

kindly and freely given them. It should be distinctly understood that the suspicious word "restoration" has included nothing but cleaning and varnishing and, in some cases, rebacking the pictures. There has been no repainting whatever, except where small patches of paint had actually fallen off, leaving the canvas bare. The condition of many of the pictures, when examined closely, turned out to be far worse than had been suspected, and it is certain that if the work had been delayed for a few years there would have been nothing left to restore in the case of some of the panels. For, in spite of the somewhat rude precautions that have been taken in many years with a view to catching the water which frequently came through to the floor above the pictures from certain parts of the roof and especially from the base of the cupola, the injury of the pictures from this cause was in constant operation. Further, it was found that the backs of the pictures were covered with shavings, sawdust, old nails and other rubbish which, at the time of the construction of the floor, had been thus disposed of by the workmen, presumably to save the trouble of their removal in a proper way. By this means the evil effects of the frequently recurring moisture were much intensified.

In consequence of the discovery that the mischief was far more extensive than had been suspected, the originally estimated cost had to be largely exceeded, and it amounted in the end to about 1,150*l*. To this there has to be added the cost of the erection of the scaffolding and its hire for ninety-two weeks which exceeded 200*l*. Hence the total cost has been about 1,400*l*.

Mr. Nairn, by whom the work was mainly executed on the part of Messrs. Morrill & Son, has very kindly placed at the service of the curators a detailed report of the condition of the pictures and of the work that has been carried out upon them. This will be found printed at the end of the present report of the curators. The curators wish to express their thanks to Mr. Nairn for this valuable and interesting record.

It was obviously important to adopt measures entirely to prevent any further injury of the same kind occurring in the future. The following steps have therefore been taken:—

1. The cupola, which ever since its erection early in the last century (unfortunately on a much larger scale than in Wren's original design), has been a constant source of trouble and expense, being far from water-tight, has been thoroughly overhauled and strengthened, especially at the parts of junction with the roof. The cost of this has been nearly 180*l*. It is now scarcely possible for any serious leakage to occur, or indeed any at all, unless in exceptionally violent storms.

2. The floor above the pictures has been covered with linoleum with closely fitted and water-tight joinings, so that any accidental leakage should ever occur it would be arrested before reaching the pictures.

3. The slated portion of the roof was found to be in a bad state, and the overlap of the slates insufficient to securely exclude wet. Thus occasional repairs were inadequate to meet the case. The whole roof has, therefore, been renovated and reslated at a cost of about 450*l*.

Occasion was taken of the necessity for removing the pipe of the organ to have the instrument cleaned throughout (this not having been done since its erection in 1877), and also to introduce some modern improvements in the pedal action and other details. This work amounted to 180*l*.

The cost of all these and of other minor improvements including the addition of a lavatory, has involved an expenditure in the last two years of about 2,400*l*. This has been defrayed from the accumulated fund arising from the generous and far-sighted bequest, about 100 years ago, of Dr. Wills, warden of Wadham College, whose experience as curator of the theatre impressed upon him the value of such a reserve to meet occasional and exceptional expenditure. But for this fund it would probably have been impossible to carry out the work which were absolutely necessary if these pictures, forming part of Archbishop Sheldon's original gift and of Sir Christopher Wren's original design, were to be saved from inevitably perishing.

#### Notes of Observations during its Restoration, 1899-1901, by Mr. R. J. Nairn.

1. The painted ceiling measures 72 feet by 64 feet, and is composed of thirty-two canvas sections.

Each section is stretched across and fastened to a wooden frame. When the ceiling was painted in 1664-69, canvas was not manufactured very wide, so the width of each section was made up by joining several pieces of canvas (24 inches wide) together at their edges. The sections are screwed to a framework corresponding in shape to the gilt-rope pattern moulding which hides the joints of the sections.

2. This framework is in turn fastened to and suspended from large beams of timber which rest on the walls of the building. The oak flooring above the ceiling is supported by oak joists resting on those beams. There is a space of about 4 feet between the floor above and the painted ceiling.

\* The work of the Press was conducted on the floor above the painted ceiling of the theatre until 1714; after that, at the old Clarendon building in Broad Street. In 1831 it was removed to the present Clarendon Press. This explains the division of the bequest of Dr. Wills (*supra*) equally between the theatre and the University Press.

† The novel and very ingenious designs of these windows as well as of those "round windows below" (now also removed) "being contrived to admit Air in foul Weather, yet not one Drop of Rain," is minutely described in Wren's *Parentalia*, p. 336.

‡ The Sheldonian Theatre is said (Elmes, *op. cit.* p. 131) to have been the first public building erected by Wren. His model and design were exhibited to the members of the Royal Society on April 29, 1663, by whom they were much commended.

§ There is, as might be expected, no entry of any payment for them in the University accounts of that period.

acing of letters. The two lines below show words spaced by e two methods. The upper line is made exactly according Professor Jacoby's proportions and spacing. It can be ticed that in it the masses of white between the letters are proximately equalised, while in the lower line the letters emselves are so evenly distributed that no two appear to and closer together or further apart than any other two.

SIDE ELEVATION  
SIDE ELEVATION

By knowing the exact widths of the letters and the exact aces between them, a draftsman, engraver, sign-painter, ultor or designer can lay off words precisely the length sired, and know they will be all right without spending time d effort in sketching them in beforehand and changing them. his is especially desirable in lettering maps.

In practice the measurements may be laid off on a piece of iff, thin paper, very close to its edge. It can then be moved out until the word occupies the right position on the drawing. hese marks can be projected from the edge of the paper or icked through to the drawing.

A very close rule for determining the length of a word efore laying it off is, Multiply all the letters by 8 and all the aces by 4.

The relations between the widths and spacing of the letters eing determined throughout the alphabet, they may be varied many ways, provided the variations are uniform. When it desired to spread out the letters and make the words longer, ny unit may be added to the spaces given in the table. The ea is the same as that of printers in spacing type when they ert blanks of equal width between the letters. If it is esired to make a word shorter, the letters can be crowded ore closely by measuring their widths by one scale and the aces between them by a scale with slightly closer divisions.

There is another method, which is derived from the evious table, and which avoids the trouble of adding the spacing s given in it. By this second method the spacing between all e letters is laid off exactly equal. The measurements, how- ver, are not taken from the extreme widths of the letters, but re laid off from points near the left of each letter (except J.). he alphabet given below shows the points from which the pacing is measured, and under each letter is given its width etween these equidistant measurements. The extreme width f each letter is the same as that given in the previous table. his uniform spacing may be any distance which is not less an three-sevenths the height of the letters.

A	B	C	D	E	F	G	H	I	J	K	L	M
16	16	16	16	16	16	16	16	16	16	16	16	16
N	O	P	Q	R	S	T	U	V	W	X	Y	Z
17	16	16	16	16	16	16	16	16	16	16	16	16

This method is best for very wide spacing on account of the apidity with which the words can be laid off; and as slight effects in wide spacing are not very apparent, the width of the etters between the spacing may be measured by the eye and ly their extreme widths measured accurately.

From numerous specimens measured and tests made, it was ound that the spacing is most pleasing in appearance when he uniform distance is some fractional part of the height of he letters, as one-half for close spacing; four-sevenths, three- ifths, or five-eighths for medium; and two-thirds, five-sevenths, r three-fourths for wide. In the following examples the stems f the letters are one-seventh of their height; the spacing in he upper line is three-sevenths, in the lower line five-sevenths, nd in all the examples shown elsewhere it is three-fifths the eight of the letters.

CLOSEST SPACING  
WIDE SPACING

When a definite length is given for a word, the spacing etween the letters can be found by multiplying all the letters y 6 and dividing the remaining distance by the number of apaces.

The roman small (lower case) letters were investigated by he same method—i.e. quite a number of the best examples ere selected, and every detail of each letter was carefully easured and averages found. The results are shown in the ollowing alphabet. Under each letter is given its width etween the equidistant spaces, as explained in the last table f capital letters.

The extreme width of each letter was found to be as ollows:—i, l = 1 $\frac{3}{4}$ ; t = 4 $\frac{3}{8}$ ; f, j, r = 6 $\frac{1}{2}$ ; g, n, h, s, u = 8 (g has

a	b	c	d	e	f	g	h	i	j	k	l	m
16	17	16	17	16	17	16	17	16	17	16	17	16
n	o	p	q	r	s	t	u	v	w	x	y	z
16	17	17	17	16	16	16	16	16	16	16	16	16

width of top, including ball, 11 $\frac{1}{4}$ ; width of bottom, 10); a, v, y, x, z, k = 8 $\frac{1}{2}$ ; b, d, p, q = 9 $\frac{1}{8}$ ; e, c = 9 $\frac{1}{2}$ ; o = 10; w = 13 $\frac{1}{2}$ , and m = 14 $\frac{3}{8}$ .

The height of the short letters is taken as 10, and the tall ones was found to be 16, which is the pleasing proportion of 5 to 3 between the lower and upper parts of the tall letters.

In slanting letters, the average slant was found to be the proportion of 2 to 5 between the sine and the cosine of the angle of slant. The proportion of 3 to 8 gives a slightly less slant, while 3 to 7 gives one which is slightly greater.

There are numerous optical deceptions in the alphabet which must be overcome in order to make the letters appear correct. They are as follows:—

A, and all letters with round tops, like O and S, must be about one-fortieth higher than the other letters, or they will appear to be too low.

C, G, O, Q, S, and the curved parts of B, D, P and R, must have the widest part of the curve about one-eighth greater than the straight stems, or it will appear too narrow.

B, E, F, H, R and S must have the middle part slightly above the centre, or it will appear too low.

B, C, E, K, S, X and Z must be narrower at the top than at the bottom, or they will appear wider.

E, N, S and X must have the bottom spur slightly larger than the top one, or it will appear too small.

The fine horizontal lines at the bottom of the letters must be slightly heavier and longer than those at the top, or they will appear lighter and shorter, and the little curved lines which fill in the angles at the bottom of the letters must be almost horizontal, while those at the top must be very small and almost vertical.

A, N, V, W, and the left half of M, must lean about three-fourths of a degree to the left, or they will appear to lean to the right, and they must have the pointed ends of the oblique stems swelled slightly, or they will appear sunken.

X must have a slight offset in the fine cross line, or the line will not appear straight.

K must have the lower part of the fine oblique line bent down very slightly, or it will not appear straight.

A piece of transparent celluloid, about one-twentieth of an inch in thickness, can be cut in the shape shown below. It

not only facilitates the work, but it greatly lessens the effort required to make the letters accurate. These angles were found by carefully measuring about two hundred well-formed letters with a protractor and taking the mean of these measurements for each angle. They are given from a vertical line. In the corresponding small letters (except y) the angles were found to be slightly greater.

Similar devices are sold by manufacturers of drawing instruments, but in them the angles have not been accurately determined and they do not give good results.

GREEK MARBLES.

A REPORT on the mineral resources of Greece, by Mr. Percy Bennett, commercial attaché to His Majesty's Legation at Athens, contains the following account of the various marble quarries:—

The marble wealth of Greece, so extensively worked by the ancients and especially by the Romans before the Italian quarries were opened up, lay neglected for many centuries. It is only during the last decade that any serious attempt has been made to develop this great national industry.

The green marble of Tinos, falsely put on the market as the genuine "Rosso Antico," and the "Rosso Antico" of Laconia were worked in a small way half a century ago by a Bavarian sculptor named Seigel, who settled down in Greece for that purpose. On the death of Seigel the property was purchased, and the business in these two marbles carried on

by a German named Kloebe. At Kloebe's decease in the eighties the estate went into bankruptcy, and his executors tried in vain to find purchasers for the quarries.

The next steps taken to reopen other Greek marble quarries were made by William Brindley, an Englishman who had been searching for many years for the genuine "Verde Antico," and who at last in 1894 discovered the original quarries of this, perhaps the most valuable marble of antiquity, between Larissa and the Vale of Tempe in Thessaly. Brindley thereupon formed a company, called the "Verde Antico Marble Company, London," for the working of these famous quarries, from which it may be mentioned were extracted the pillars of the new Roman Catholic Cathedral in London.

This marble is brought down by rail to Volo, and thence either shipped to the central dépôt at Leghorn or direct to the purchasers. It is the genuine "Verde Antico" in different shades, some dark and some light. In all probability the large antique columns of the church of San Sophia, Constantinople, the large columns in the Neapolitan and Roman Museums and the rich decorations in St. Mark's, Venice, came from these quarries.

In 1896 an English company was formed under the name of "Marmor, Limited," with a nominal capital of 300,000*l.*, with central offices in Finsbury Square, London, for purchasing, renting or working the various quarries of white or coloured marbles throughout Greece.

The Pentelikon quarries near Athens owned by this company are of world-wide fame, and produce the celebrated blue and white marbles. The old quarries on this mountain, from which the columns of the Parthenon and other buildings of ancient Greece were extracted, still remain and are worked in a small way; but the most extensive extraction is now carried on at the western end of the south side of the mountain and on the north side. The Pentelikon marble is principally white of various qualities, but there is also a good deal of dark blue marble called "Melana" or ink marble. To work these quarries the company has laid down railways, inclined planes, wire-sawing machinery and sawing and polishing sheds. An interesting contract to which the "Marmor Company" is committed calls for 900 tons of Pentelikon marble per month for three years.

After Pentelikon, the largest number of quarries are found in the island of Skyros, where the alabaster white, white tinged with violet, white tinged with yellow, and the variegated red and white marbles are all extracted. These marbles, however, are of exceedingly fine grain and are difficult to obtain in large blocks.

The old quarries of Seigel and Kloebe in Tinos have been purchased by the company and are being worked by steam machinery. The Seigel and Kloebe quarries in Laconia have also been purchased by "Marmor, Limited," but at the present time are not being worked owing to the unfriendly attitude of the peasants. This marble, which is perhaps as valuable as the "Verde Antico" of Thessaly, is found in layers in the mountains far from the sea. At intervals of 10 to 15 inches white patches appear, and the good marble of the deep red pigeon blood colour is taken from between the two veins of white. It is proposed to work these quarries after the manner of coal-mining by following the strata underground.

Perhaps the largest quarries of antiquity, larger even than Pentelikon or the "Verde Antico" in Thessaly, are the Styra quarries dotted round the southern end of the island of Eubœa (Negropont). Of all coloured marbles this is most in vogue at the present moment. It has the great advantage that it can be extracted in almost any lengths, and pillars and other decorations of this marble have recently been supplied for the Royal Academy, the Roman Catholic Cathedral at Westminster and the Belfast Town Hall, the contract for the latter being the largest ever taken out for marble decoration. The quarries of this marble are owned partly by "Marmor, Limited," and partly by Mr. Brindley. The quarries in the island of Paros have not yet been satisfactorily reopened. From the Parian marble the Venus de Milo in the Louvre was carved, but it is believed that some of the veins have already been worked out. These quarries are owned partly by "Marmor, Limited," and partly by a Greek company, which, however, is in course of liquidation. Nearly all the other known marble quarries in Greece are owned by "Marmor, Limited," and are intermittently worked by them. This company extracted:—

Year.	Quantity. Cubic metres.
1896-97 . . . . .	756
1898 . . . . .	1,472
1899 . . . . .	2,275
1900 . . . . .	3,016
1901 . . . . .	4,355

Of the 4,355 cubic metres extracted in 1901, 857 cubic metres were exported, 930 cubic metres were delivered for use in Athens, 1,625 cubic metres were delivered for the Stadium, and 943 cubic metres remain at the quarries.

## TESSERÆ.

### Stothard Studies.

WHEN a student at the Academy, Stothard never down to draw for a long period from a single figure and disapproved of the tentative practice of rubbing out and groping after correctness. He made quick but careful lines in pen and ink, changing frequently his position, and producing many drawings of the same figure. Truth of outline he felt to be first necessary, after which light and shade would be easily studied. Like Hogarth, he never painted from a living model. A friend, who was painting an historical picture and wished to have his opinion of it, asked Mr. Al. Stothard to bring his father while the living model was standing. On being told that he never used a model, "Then stands alone," was the answer; "I can now understand it is all Stothard's works are so graceful." He had acquired the art of storing images in his memory. In seeking the images, when not at his easel or his books, he was ever active and busy. Faces and forms he met with in the streets or in society were treasured with the same care that Turner treasured passing effects of clouds and shadows. When Boydell, Lord Mayor, asked him to a ball at the Mansion House, he took his sketch-book, and perhaps the citizens of "Cheape," the "Canterbury Pilgrims," are reminiscences of that evening. His country rambles were frequent; as early as 1777, visiting with his mother her native town of Shrewsbury, he made sketching excursion into North Wales. Such tours he afterwards made, and used his sketches for the beautiful backgrounds of his pictures. Having to paint a sylph, he said to a friend that he hardly knew how to paint such a being in fancy. "Give a butterfly's wing, and you have it," was his remark. "That I will," he replied; "and, to be correct, paint it from nature." He went to the distant fields and brought home a peacock butterfly, and on an accident happening to a portrait before it was finished he went again and brought a tortoiseshell species. Astonished at the beauty and variety of the combinations of colour, he thenceforth became a lover and collector of Papilionaceæ, and used to tell how much he owed to their "study in the art of colouring." Of flowers and plants he was an ardent admirer for the purposes of art, and delighted to ramble among the fields or hedgerows, and on the spot copy the wild plants which arrested his notice. When he could not be out of town, he used to go in the morning to Covent Garden, and bring home any flowers to paint which struck his fancy. These flower sketches proved of great use in a style of work in which he had much employment—designing patterns for plate and ornamental jewellery. Even in shops he found useful studies, and he used to walk sometimes on purpose to note the effects of the rich silks displayed in some mercers' windows. The draperies of many of his female figures are much admired, and were doubtless the results of these frequent observations. In all his works, whether the most important or the most trifling, he endeavoured to attain whatever correctness study could command. When illustrating Shakespeare he took his dresses and armour and everything historical from the authority of ancient monuments and manuscripts, and spared no effort to acquire the correctest knowledge on his subjects. And in the same spirit he used to take sketches from all illustrated books of voyages and travels, that they might be of use when his scenes happened to be laid in those countries.

### Orientation of Roman Churches.

The question of orientation is of great interest in Roman architecture. It has often been assumed that the Roman use was to orient churches always to the west; that is, to have the apse and altar at the west part of the building, and the chief entrance at the east end. This way would be the direct reverse of our own custom—which is to always have the chief entrance at the west and the choir and altar at the east end of a church—for the circumstance that it was the custom to turn the altar round, as it were; in other words, for the celebrant to stand behind the altar with his back to the apse, and looking over the altar towards the people in the nave. In this case, if the basilica orientated west, the priest and altar would obviously face, or orientate, correctly. Although correct orientation was a law of the ancient Church generally, yet it could not be made an essential rule in Rome for the very same reason that explains faulty orientations in some of the old cities of Northern Europe, viz. that free sites could not always be had, and that the lines of existing streets had to be followed. Many of the most ancient churches will be found to lie parallel with, or else at right angles to, existing streets which we know to occupy the same directions as in ancient Rome. Examples are: St. Cesareo, St. Clemente, St. Giorgio in Velabro, St. Giovanni in Portam Latinam, St. Maria in Trastevere and St. Lorenzo in Pane e Perna. But where large sites were probably cleared, then, as in St. Peter's and St. Giovanni Laterano, the basilicas were made to orientate west while their altars orientate east; that is, the orientation of the altar was preferred to that of the church. Another thing to be remembered is the practice

difficulty occasioned by the peculiar basilican arrangement. The shop and priest being in the apse behind the altar would have been in a great measure cut off from the Liturgy if the altar had not been made to orientate differently from the church. The natural way, considering their locality, was to orientate the altar so that the celebrant should stand with his back to them. This accordingly was done, and the people were enabled to witness the eucharistic service, by the altar being easily raised, and having no superaltar or "altar-piece" of any kind to obstruct their view. It will simplify one's thoughts on this subject to remember that the basilican arrangement very much differs from our own in this, that the choir and altar are inverted. If in a basilica one could turn the apse and altar into a round, the result would be our own arrangement; the magnificent choir of course making way for the holy doors, and the bishop's seat being placed on one side. The impossibility of orientating both altar and church rightly, so long as the basilican arrangement was retained, was one great reason for its arrangement being discarded. In the churches of Ravenna, Torcello and St. Miniato, the altars are made (at least now) to orientate like the churches; and in Rome itself churches built at a later date, such as St. Maria del Popolo, St. Maria sopra Minerva and SS. Vincenzo ed Anastasio are orientated rightly both in themselves and their altars.

### Thorwaldsen the Sculptor.

Thorwaldsen's career commenced in poverty and darkness; when the world came to know him he was famous. In his early years no one had an interest in the fate of the poor ill-dressed and lank-haired boy who helped his father—a third or fourth-rate carver and frame-maker at Copenhagen—to execute his clumsy figure-heads and "gallions," or who carried a tool-basket after the drunken old artisan, when that person went for some job-work to the houses of the wealthy merchants and auctioneers of the Danish capital. The boy's talents, indeed, attracted some attention, and it was remarked that by his assistance old Thorwald succeeded now and then in carving a real lion for some ambitious merchant captain; whereas, before young Bertel Thorwaldsen grew up, the clownish old fellow could only carve lions and made them French poodles. But what of that? The world as it goes is far too busy with its own affairs to care much for the precocious talent of a poor artisan, especially if he have only his talent to rely on, and if, like Bertel, he wants assurance, fluency of speech, and that mixture of boldness and humility which the patrons of art value more than even art itself. Hence it is no wonder that Bertel's way of life the world could not keep pace with the development of his genius. His youth passed unnoticed in his father's workshop and the drawing school of the academy, and the little that is known of the boy Bertel is chiefly derived from a few anecdotes told his friends and partly from certain documents which the Copenhagen Academy preserved, not because it attached any particular value to them, but merely because the rules required all such papers to be filed and registered. These documents show that Bertel Thorwaldsen, after gaining the three highest prizes for drawing, composition and modelling, had to petition for a wretched pittance of 20*l.* per annum to assist him in his studies, and that afterwards the same course of humble petitioning was gone through for the sake of the "travelling stipend" of 80*l.*, to which successful young artists were entitled. The grant of this "stipend" concludes the young artist's history in his own country. Scarcely a trace is left of his career between the day of his departure from Copenhagen and the day on which his first independent works revealed him to the astounded world (that is to say, to the small part of the world which cares for such matters) as a rival of Canova.

### Lorenzo Ghiberti.

Besides his excellence as a sculptor, Lorenzo Ghiberti has other titles to fame. Not only did he design the window for the cupola of Santa Maria, Florence, but he exercised so marked an influence on art in general that we are sure to find his name wherever a progress is visible. The bas-reliefs on the bronze doors of the Baptistery also form an epoch in the history of painting, or at least in that of design, which he raised at once to a degree of elegance and purity to which no painter before him had approached: indeed Raphael himself did not disdain to profit from his manner of draping, grouping, and arranging his figures; and there is cause to regret that the Florentine school did not avail itself of his inspirations in reference to all others. It is to Ghiberti that we are indebted for the first history of art in Italy, a noble and patriotic undertaking, for the execution of which he united every possible advantage, since, on the one hand, the materials for it abounded everywhere, either in the archives or in the monuments, the greater number of which were still perfect; while on the other, he found himself placed exactly on the limit which divided the old school from the new. Unfortunately, a fatal prepossession in favour of ancient art made him attach such an importance to the authority of Pliny and Vitruvius that the extracts from these two authors fill the greater part of his manuscript, whilst

the history of modern painting only occupies a small number of pages. The sculptures of Ghiberti laid the foundations of a progress which was realised in the works of his disciples, who, like himself, had served their apprenticeship in the workshops of the goldsmiths before they assisted him in giving the finishing touches to the doors of the Baptistery. The most skilful of his coadjutors was Masolino, who understood the distribution of light and shade better than any of his predecessors, as may be seen in the famous chapel of the Carmine, where he began at an early age to paint the history of St. Peter, which death did not permit him to complete. The work was continued by Masaccio, who interests us still more both on account of his early death, which happened in his twenty-sixth year, and also from the more lasting and universal admiration he has excited.

### Fra Angelico.

It is a curious and instructive circumstance and one which illustrates the unforeseen bearings of one branch of knowledge upon another, that the surest indications of the approximate dates of Fra Angelico's paintings (where external testimony is wanting) are to be found in certain accessories, and more especially in the architectural setting which he so often introduces into his pictures. Once this key to the problem is grasped, it becomes a comparatively easy matter to trace, for instance, the progress from the Gothic framework of his earliest *Annunciation* to the Corinthian columns of his Cortona picture of the same subject, from these again to the imperfect Classical entablature of the Madonna di Annalena, and thenceforward to the full entablature with cornice, festooned frieze and architrave of the Madonna di S. Marco. It is not merely that the points of difference mark an advance from an earlier to a later period, but in more than one case the actual sculptural prototypes of Fra Angelico's canopies, which are in fact works of Brunelleschi or of Michelozzi, can be positively dated, and thus a *terminus a quo* can be established, before which the particular paintings cannot be placed.

### Irish Romanesque.

The introduction of Romanesque architecture into England is marked by the erection of Westminster Abbey by Edward the Confessor in 1066, portions of which original building may still be seen in the Canons' Garden of the Abbey. Fifty years before this date the little church of St. Caimin of Iniscailtra was built by King Brian Boru, and this building marks the transition to the enriched round arched style of Ireland. It appears that at this period in England a primitive Romanesque style already prevailed, which, though it has been termed Anglo-Saxon, was of purely Italian origin. This early style modified the character of that which in the reign of Edward the Confessor came as a fresh importation from Normandy, and to this source may be traced whatever distinctive features separate English-Norman from that of Normandy itself. In Ireland, as we learn from such buildings as Maghera, Banagher and Temple Martin, a distinct style also prevailed at the time in which the Romanesque of Normandy was introduced there. Rude as many of its examples are, this primitive architecture still had sufficient vitality and character to modify the incoming Romanesque and to live on, manifesting itself notwithstanding the fresh forms engrafted upon it. The style in Ireland of the eleventh and twelfth centuries is an Irish-Romanesque style, and the peculiarities by which it is distinguished are "native traditions handed down from earlier native buildings," such as the primitive erections of the fort builders and of the early Christian missionaries, characterised by the horizontal lintel or entablature, a style to be seen in the first buildings of all countries, and which may be classed as belonging to the architecture of necessity. The Romanesque churches of Ireland are remarkable for the diminutive size and simple ground plan. They are characterised by the lingering of horizontal forms and incorporation of such in the round-arch style, the retention of the inclined jambs of the primitive doorways, their rich and delicate decoration and the constant use of certain ornamental designs, characteristic of the late Celtic period, which had been common to Britain and Ireland before the Roman occupation of Britain.

### Individuality in Art.

Industry alone can only produce mediocrity, but mediocrity in art is not worth the trouble of industry. Genius, great natural powers, will give industry and ardour in the pursuit of their proper object, but not if you divert them from that object into the trammels of commonplace mechanical labour. By this method you neutralise all distinction of character—make a pedant of the blockhead and a drudge of the man of genius. What, for instance, would have been the effect of persuading Hogarth or Rembrandt to place no dependence on their own genius, and to apply themselves to the general study of the different branches of the art and of every sort of excellence, with a confidence of success proportioned to their misguided efforts, but to destroy both those great artists? "You take my

house when you do take the prop that doth sustain my house." You undermine the superstructure of art when you strike at its main pillar and support, confidence and faith in nature. We might as well advise a person who had discovered a silver or a lead mine on his estate to close it up, or the common farmer to plough up every acre he rents in the hope of discovering hidden treasure, as advise the man of original genius to neglect his particular vein for the study of rules and the imitations of others, or try to persuade the man of no strong natural powers that he can supply their deficiency by laborious application.

#### Galleries of Sculpture.

At Rome in the eighteenth century Cardinal Albani formed a collection of the finest remains of ancient sculpture that could be procured; and by attaching to him all the most distinguished litterati and the best artists of his day made his palace the resort of all who felt an interest in the pursuits to which he himself was so devoted. Under the auspices of this "Hadrian of his age," as Cardinal Albani has been justly called, Winckelmann produced the first work in which the history of the arts of design had been treated in a learned, philosophical and scholarlike manner; and it has been the model and groundwork of all succeeding and improved works upon the same subject. The popes Clement XII. and Benedict XIV., as well as Clement XIII. and Clement XIV., contributed also to create a feeling for the sculpture of the ancients by accumulating monuments of various kinds in the pontifical palace. To Clement XIV. we are indebted for the foundation of the Museo Clementino in the Vatican, which received such noble additions by the liberality of his successor Pius VI., that the name of the latter pontiff was associated with that of its founder in giving a title to the collection, and a considerable portion of the gallery of ancient sculpture is still known as the Museo Pio-Clementino. Till Pius VI. issued an order to prevent the removal of works of art, the remains of antiquity discovered in Rome and its neighbourhood could be sold and taken out of the country. The Pope, desiring to increase his collection and preserve to Rome whatever could be recovered by excavation, prohibited anything being removed out of his dominions without a special permission. This order procured for his agents the first choice of whatever statues or other monuments of sculpture were found, and the extensive purchases effected by this means soon filled the Vatican with works of ancient sculpture, which, with the additions made by succeeding popes, have made it the most celebrated, as it is the most valuable collection of its kind in the world. The discovery of the long-buried remains of art in Herculaneum and Pompeii led to the formation of a museum of the same kind at Portici, and in bronzes especially the Neapolitan collection is without a rival. Among the sovereigns of Italy who contributed to the revival of design, Leopold, grand-duke of Tuscany, must likewise be included.

#### The English Records.

Whether we consider them in relation to antiquity, to continuity, to variety, to extent, or to amplitude of facts and details, the English archives have no equals in the civilised world, for the archives of France, the most perfect and complete in continental Europe, do not ascend higher than the reign of St. Louis, and, compared with ours, are stunted and jejune; whereas in England, taking up our title (so to speak) from Domesday, the documents, which by the Record Act, the Treasury minute of August 8, 1848, directing the incorporation of the State Paper Office with the Public Record Office, and the Order in Council, are or will be placed under the care of the Master of the Rolls, contain the whole materials for the history of this country, in every branch and under every aspect, civil, religious, political, social, moral, or material, from the Norman Conquest to the present day. Chasms there are, but the only one of importance is that intervening between Domesday and the Great Rolls of the Exchequer, viz from 1088 to 1130; and inasmuch as in the reign of Henry II. we have authentic testimony that scarcely any documents of the reign of the Conqueror, with the exception of Domesday, existed, it is most probable that none were ever framed. And with respect to subsequent periods, though occasionally particular classes of documents may fail us, yet the place of the documents lost or non-existent is always fairly well supplied by others affording information nearly equivalent. It is needless to state that the Public Records, accompanied by the State Papers and Government archives, now united to the department of the Public Records, constitute the backbone of our civil, ecclesiastical and political history; but their value is equally great, though as yet not sufficiently appreciated or acknowledged, for the investigation of those special and collateral subjects without which the mere knowledge of public or political affairs affords but a small portion of the information needed for elucidating the mutations and progress of society. The real history of the Courts of Common Law and Equity, nay of every branch of jurisprudence, save and except the statute

law, has never yet been written, and so far as respects the earlier eras, the standard work first placed in the hands of the legal student is a congeries of errors, equally with respect to our ecclesiastical, our political and our legal institutions. The statistics of the kingdom in every branch or head of inquiry—revenue, expenditure, population, trade, commerce, or agriculture—not one of which has been treated otherwise than imperfectly and preparatorily, can from these sources be investigated with marvellous satisfaction and accuracy. In some respects no portion of their contents will be found more interesting than those transmitted from the Treasury, of which the existence even can scarcely have been said to have been known. For naval history, in like manner, the Admiralty documents are of the greatest importance. No less useful are the State Paper Office, Government Papers, records and archives for the exploitation of special subjects of research. The documents afford also untouched mines of information relating to private history of families.

#### GENERAL.

**The Senate of Dublin University** have conferred the honorary degree of D.Litt. on Professor W. Ridgeway, Professor of Archaeology in the University of Cambridge.

**Mr. Alfred Waterhouse, R.A.**, has given 100*l.* towards the national memorial to Queen Victoria.

**The Contract** for the third section of the Paris underground railway has been let, the amount being 17,000,000 francs. The line will be constructed under the Boulevard des Capucines, the Place de l'Opéra, and the Rue de Quatre-Septembre.

**Mr. Robert Burton Buckley**, chief engineer and secretary to the Government of Bengal in the Public Works Department, was invested by the King on Monday with the Order of the Star of India (C.S.I.).

**Mr. George Frampton, R.A.**, has been commissioned to execute the monument which is to constitute the Lee memorial to Queen Victoria, and which includes a statue of his late Majesty.

**M. Georges Becker** has completed his painting which represents the visit of the Emperor and Empress of Russia to the Hôtel de Ville, in Paris, in October 1896. It is to be placed in the Imperial Palace, St. Petersburg, and a replica to be executed for the Paris Municipality.

**A Committee** has been formed to present to the St. Deiniol Library, at Hawarden, a statuette in silver of the late Mr. W. E. Gladstone, by Signor Raggi, whose Gladstone statue at Manchester was recently unveiled.

**M. E. Bénard**, architect, has been appointed Professor of Elementary Architecture at the Ecole des Beaux-Arts, in the place of the late M. Coquart.

**Mr. David Robertson, B.Sc.**, lecturer in electrical engineering at the Bradford Municipal Technical College and formerly assistant lecturer at the Glasgow and West of Scotland Technical College, has been elected to the vacant chair of electrical engineering in the Merchant Venturers' Technical College, Bristol.

**M. Ernest B. Michel**, portrait painter, died at Montpellier at the age of sixty-nine. M. Michel was conservator of the Fabre Museum at Montpellier, honorary director of the district Ecole des Beaux-Arts, and formerly inspector of instruction in design.

**The Belfast Harbour Board** will shortly invite tenders for a dock 750 feet long on the county Down side of the harbour, with an entrance of 100 feet in width.

**The Falls of the Rhine at Schaffhausen** are now illuminated at night by means of electricity. The spectacle will take place three times a week during the present month, and afterwards on every evening until September.

**The Late Mr. Thornycroft's group of Boadicea** in a war chariot will shortly be in position on the Embankment near Westminster Bridge. The complete bronze casting will weigh about 12 tons.

**The Baths at Worthing** are to be improved at a cost of about 5,000*l.*

**The Metropolitan Asylums Board** have forwarded complete drawings, and a detailed estimate of cost amounting to 3,779*l.* 18*s.* 3*d.*, of the proposed additional staff accommodation at the Caterham Asylum to the Local Government Board for formal approval.

**The Court of Appeal** decided on Wednesday that Drury Lane Theatre was not to be considered as a "factory" under the Workmen's Compensation Act.

**A New Union Workhouse** is to be built at Abergavenny and Mr. E. A. Johnson, F.R.I.B.A., of that town, has been appointed architect for the work.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## THE CORONATION.

**THE ARCHITECT will be published on WEDNESDAY, JUNE 25. All Advertisements, Tenders, and Contracts Open intended for insertion in that issue must be received at the Office, Imperial Buildings, Ludgate Circus, not later than 3.30 p.m. on Tuesday, June 24.**

## COMPETITIONS OPEN.

**CREWE.**—June 12.—Designs are invited for new municipal offices and council chamber. The author of the design which is adjudged best will receive a premium of 50*l.*, and he will be appointed to carry out the design; second premium, 25*l.* Particulars will be supplied by the Borough Surveyor, Municipal Offices, Crewe.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford, S.E.

**HARTSHILL.**—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Trent, invite designs for a home for nurses at Hartshill, Stoke-upon-Trent. Particulars may be obtained on application to Mr. Albert E. Boyce, secretary and house governor.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Sept. 15.—Designs are invited or new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

**WEST HARTLEPOOL.**—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

COL. FREDERICK BAILEY, R.E., Edinburgh, held a public inquiry at Perth on the 24th ult. into a memorial presented by the Lord Provost, magistrates and Town Council of Perth to the Secretary for Scotland under Section II. of "The Perth Improvement Act, 1893." The memorial set forth that on June 21, 1898, the memorialists obtained an order from the Secretary for Scotland approving of the scheme submitted to him for the erection of one block of houses in South Street suitable for persons of the labouring class, in order to carry out the formation of a new street between the South Street and City Hall. After hearing statements, Col. Bailey said he had that day visited and inspected the site in company with the Lord Provost and certain members of the Council, and he had satisfied himself by personal inspection as to the suitability of the site the Town Council now proposed. He then asked whether or not any objections were raised to this site. There were none.

## TENDERS.

TRADE NOTES.

MESSRS. WM. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have received instructions to make a new turret clock and bell for the city authorities, Georgetown, Demerara, West Indies, they having previously supplied them with a clock twenty years ago, which has given the greatest satisfaction. They supplied a turret clock and bell for His Majesty's Government, and another for the trade in the West Indies some years ago. Messrs. Potts are also making a new turret clock for the Governors of Hipperholme Grammar School, Yorks.

THE report to be submitted by the directors of the Sun Insurance Office at the annual general meeting on Wednesday next sets forth that the premiums received, less reinsurances, amount to 1,165,346*l.* 12*s.* 6*d.*, being an increase of 94,789*l.* 19*s.* 4*d.* as compared with those of the preceding year, while the total of the sums insured during the year, after deduction of the amounts reinsured, exceeds 460,000,000*l.*, and that the losses paid and outstanding amount to 670,633*l.* 14*s.* 6*d.*, being at the rate of 57·55 per cent. on the premiums received. A dividend of 4*s.* 6*d.* per share is declared (an interim dividend of 4*s.* per share having been paid in January), leaving 102,731*l.* 7*s.* 1*d.* to be carried forward.

BUILDING AND BUILDERS.

PRINCE CHRISTIAN visited Walsall on the 29th ult. for the purpose of laying the foundation-stone of a new town hall, which is to cost about 100,000*l.*

THE foundation-stone was laid on the 29th ult. at Widnes of a new Sunday school in connection with Oakland Street Wesleyan chapel, the cost of which will be about 15,000*l.*

THE Basford District Council have approved the schemes prepared by Mr. J. R. Elliott, A.M.I.C.E., of Nottingham, for the sewerage of the parishes of Colwick, Gedling and Burton Joyce. The loans applied for are as follows:—Colwick 6,000*l.*, Gedling 6,500*l.* and Burton Joyce 6,400*l.*

THE parish church at Northorpe is to undergo thorough restoration. The Ecclesiastical Commissioners have undertaken to repair the chancel at the estimated cost of nearly 400*l.*, and Mr. Hodgson Fowler, architect, of Leeds, has pre-

Contractors to His Majesty's Office of Works, War Office, and Admiralty.

pared an estimate, placing the cost of restoring the rest of the church at 1,000/.

THE foundation-stone was laid on the 30th ult. of the new day schools in connection with St. Anne's Roman Catholic church, Stretford. The schools are estimated to cost 1,800/., and will provide accommodation for 200 children. The architects are Messrs. Sinnott & Howell, and the builder is Mr. Charles Walker, of Preston.

WHILST some men were engaged in cleaning the front of the Prudential Insurance buildings in Sunridge Road, Bradford, a ladder which they were using as a scaffold broke, and they fell a distance of 30 feet. Alf. Hemmingway, of Lower Thomas Street, and Robert Hall, of Whetley Hill, Bradford, were both rendered unconscious and taken to the infirmary, where they were detained.

THE congregation of St. Margaret's parish church, Arbroath, have resolved to erect new church halls on vacant ground adjoining the church in Keptie Road. The buildings are to consist of a hall to accommodate 250, a session-house, guild-room, cloak-room and lavatory accommodation. The hall will have a gable with a three-light window facing Keptie Road, and the general architecture is to be treated so as to harmonise with the church. It will be a question for the congregation to consider whether the tower should not be completed at the same time by the erection of a graceful spire.

THE experiment of staging Yiddish plays has turned out so well that the improvised theatre at Hackney is to be abandoned, and a new theatre, exclusively devoted to Yiddish drama, erected. Negotiations are already in progress for the acquisition of a site in Aldgate, for which 6,000/ has been offered. In addition, it is proposed to spend 24,000/ on the building itself, so that the Yiddish theatre will certainly cost as much as 30,000/., accommodation being provided for 3,000 people. In New York, by the way, there are four such theatres, but the city contains half a million Jews among its population.

A YEAR ago the master and operative masons of Crieff entered into an agreement for a year that the wages be 8/ per hour. The masters also accepted the by-laws held by the men as follows:—That they receive 3s. per week extra while working in the country; hot plates at dinner time; and that the agreement hold good for a year. The agreement expired on May 31, and the men asked the masters to renew the same. Two of the masters accepted the terms, but three others agreed to accept the rate of wage at 8/ per hour, but refused the by-laws.

The men of the latter accordingly came out on strike on Monday.

ON Saturday afternoon the foundation-stone was laid of new Board school which is to be erected at Hulme, Lancs., at a cost of 7,000/.. It will afford accommodation for 380 boys, and is in a sense the successor of the old Christ Church British school, which was carried on by the Gaskill trustees prior to being transferred to the School Board. For so long time an iron building has done duty as a school, the members of the Board thinking it best to see what shape the developments of trade and industry would take in the neighbourhood before committing themselves to the expense of a permanent building. That a good school is a necessity in such a district no one can doubt. The building is to be of brick, with terra-cotta dressings. It is being erected by Messrs W. A. Peters & Sons, of Rochdale, and it will take the old title of Christ Church school. There will be six large classrooms, two cloak-rooms and a fine central hall.

### VARIETIES.

THE Chancery Lane Safe Deposit Company have made special arrangements for the temporary safe keeping of court jewels and other valuables during the Coronation ceremonies.

MR. C. C. JOLLIFFE, who has been for thirty-five years in the service of the Leeds Corporation, has, owing to advancing years and impaired health, resigned the post of deputy town clerk. The salary attached to the office was 600/ a year.

MR. R. A. H. TOVEY, solicitor, out of sixteen candidates has been elected town clerk of Doncaster. Until lately Mr. Tovey was a member of the Town Council. He resigned to apply for the appointment, the salary of which is 500/., with 40/ as borough coroner.

THE new pulpit recently erected in the nave of Glasgow Cathedral was formally dedicated on the 1st inst. Dr. M'Adam Muir officiated. The pulpit is the gift of Mrs. Granger in memory of her husband, who was sometime assistant to the Rev. Dr. Burns in the cathedral. The pulpit is of oak, octagonal in shape, and is richly adorned with carving and many traceried panels. The design was prepared by Mr. Macgregor Chalmers, architect, and the work was executed by Mr. Grant and Mr. Crawford.

HOTEL DE VILLE, LA ROCHELLE.

THE Court of Governors of Owens College, Manchester, at a meeting on Wednesday decided to apply for a charter for an independent university in Manchester, to be called the Victoria University of Manchester. The Court were of opinion that any powers and advantages possessed by the Victoria University and its graduates, including the use of the name Victoria, should be equally continued if they desire to the proposed universities in Leeds, Liverpool and Manchester and their graduates.

THE Derby Corporation on the 4th inst. made the final choice of a town clerk and Registrar of the Court of Record. There were twenty-eight candidates originally, but these were reduced to the following four gentlemen, who had previously appeared before the Council:—Mr. W. H. Andrew, aged forty, town clerk of York; Mr. G. Trevelyan Lee, aged thirty-six, town clerk of Dewsbury; Mr. F. C. Lloyd, aged forty-one, town clerk of Huddersfield, and Mr. H. Mansfield Robinson, town clerk of Shoreditch. Voting took place by ballot, and resulted in the appointment of Mr. Lee.

ARRANGEMENTS are being made by the Surveyors' Institution for holding a conversazione on Friday, July 4, between the hours of 9 and 12 P.M., at the Natural History Museum, Cromwell Road, South Kensington, by kind permission of the Trustees of the British Museum. A card of invitation will shortly be issued to every member of the Institution. The members and the ladies accompanying them will be received by the president of the Institution, Mr. Arthur Vernon, in the central hall of the Museum. The District Railway Company has been asked to open the subway from South Kensington Station to the grounds of the Museum.

AT Friday's meeting of the finance committee of the Leicester Corporation Mr. Hiley (deputy town clerk of Birmingham), Mr. Copnall (town clerk of Rotherham) and

Mr. Jarratt (town clerk of Southport) were selected out of eighteen applicants for the position of town clerk of Leicester at a salary of 1,000*l.* The names will be submitted to the Council for final selection. Mr. Sanders (solicitor to the Liverpool Corporation), Mr. Hughes (town clerk of Lancaster) and Mr. Lloyd (town clerk of Huddersfield) were among the unsuccessful candidates.

MESSRS. FOSTER & CRANFIELD announce the sale on the 18th inst., at the Mart, of Kylemore Castle, Connemara, an important and beautiful property, which is situated at the foot of the southern slope of the Doughruagh Mountain, and stands on a wide terrace at the north-west corner of Lough Pollacappul, the site commanding a grand prospect of Kylemore Pass, bounded by an amphitheatre of mountains, the acclivities forming the sides sloping to the water's edge. The sumptuous baronial castle and luxurious grounds are the result of Mr. Mitchell Henry's lavish expenditure, and the estate offers abundant sport of every description.

## ART AT LAMBETH.

MESSRS. DOULTON & CO. have just now on view in their handsome galleries at Lambeth a noteworthy collection of artistic specimens of their work in terra-cotta, faience, majolica and porcelain, all of which attain to a very high order of merit. This is, however, not surprising to anyone acquainted with the work ordinarily turned out by this celebrated firm.

Among the works shown, the *place d'honneur* is rightly given to three large terra-cotta panels in high relief by Mr. George Tinworth. The subject of the largest of these is "The Entry of the Apostle Paul into Rome," and it is treated in a bold and masterly manner. The figures, of which there are a large number, are instinct with life and movement, the central group of the apostle chained by the arm to a slave being conveyed in a chariot into the city being full of dignity and grace.

Equally artistic treatment distinguishes the other two panels, which portray respectively "The Visit of the Shepherds" to the birthplace of the Saviour, and "The Visit of the Wise Men." These panels, which are somewhat smaller, have, we believe, been designed for Chinworth parish church. Among other works in terra-cotta are a fountain of pleasing form in "new art" style, garden seats, sundials, vases and flower-pots, all of exceedingly decorative and artistic design;

## WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

TECTURAL CASTINGS.

**WILSON & CO.**

24 HARRISON STREET,  
GRAY'S INN ROAD,  
LONDON, E.C.

some graceful pergola columns of graceful proportions and a Persian arch are also to be seen, while in glazed ceramic ware a monumental grill case in brilliantly coloured Mauresque style occupies a prominent place.

In numerous cases around the galleries are disposed exquisite examples of decorative and domestic porcelain, but the artistic productions of the Royal Potteries in this *genre* are too well known to require detailed description. In this department, however, are shown some specimens of the goblets to be presented to the participants in the King's dinner to the poor. These are of graceful form and perfect finish, and, bearing as they do excellent portraits of their Majesties and a suitable inscription, will serve as a valuable souvenir of an important historical event.

A very interesting feature of the exhibition is a group of potters at work fashioning on the wheel in the moist clay the graceful objects which, in a finished state, adorn the surrounding cases, and the interest is not lessened by the fact that the artists are pleased to impart information as to details of their art to visitors who may happen to be of an inquiring turn of mind.

MESSRS. EWART & SON, LTD., of Euston Road, have just introduced a new radiator which deserves the attention of our readers. It possesses the following excellent points:—Is complete in itself and requires merely a small gaspipe to be attached (a piece of rubber tube will serve), and to be filled up with water when first used. It requires no further attention and no cutting away for service-pipes. There are no boilers to get out of order and it is comparatively inexpensive.

BAILEY'S patent "Geyser" hot-water supply, which is being shown by Messrs Clark, Hunt & Co, Shoreditch, is a new system of obtaining a supply of hot water over a sink without the need of a feed cistern and hot-water tank. The cold-water supply pipe is in direct connection with the boiler and is controlled by a stopcock over the sink. The outflow pipe from the boiler terminates with a brass nozzle below the stopcock. When the stopcock is opened cold water flows into the boiler and causes a rapid discharge of hot water through the nozzle below the stopcock. When the stopcock is closed the discharge ceases, leaving the boiler full. The sink may be any reasonable distance from the range; the impetus of the discharge partly empties the outflow pipe, leaving but little "dead" water.

### ELECTRIC NOTES.

THE report by the lighting committee of the Motherwell Town Council of their first year's experience with electric light is most satisfactory. At a meeting of the Town Council Councillor Wilson, of Burngrange, stated that there had been an income of 3,036*l.*, and that the total cost of working had been 1,000*l.* They had produced for public and private purposes 189,000 units at a cost of 1*·*44*d.* per unit. This was most satisfactory, and the committee recommended that the charge for illuminating purposes be reduced from 5*d.* to 4*d.* per unit, and that for power the charge be reduced to 1½*d.* for over 50 units, and to consumers of under that quantity to 2*d.* per unit.

A CONSIDERABLE amount of rapid illumination work in celebration of the Peace Proclamation was placed in the hands of the Electric-Lighting Boards Company of 7 Pall Mall, on Monday, and this was a most suitable occasion to show how rapidly electricity can be applied on this system as compared with the installation of gas devices. Quite a number of the orders for illuminations did not reach the company until 4 P.M., but the illuminations were full alight by eight o'clock. Amongst the installations was a large display at the P. & O. offices in Northumberland Avenue, and at the United Service Club in Pall Mall, opposite the company's own office, where there was also a large display. A number of the royal warrant-holders similarly had displays in Regent Street and Bond Street, and among the restaurants illuminated was notably the Café Royal. A record fixing in the evening was that of 280 8 candle-power lights in 1 hour 20 minutes by two men and one boy, including six principal connections, which, taking into consideration the difficulty of working in view of a large and demonstrative crowd, comes very close to the company's French and American time records for rapid illuminations on the E.L.B. system.

### CITY AND GUILDS OF LONDON INSTITUTE.

THE report issued by the Council to the members of the Institute contains the following:—

#### CARPENTRY AND JOINERY.

##### *Preliminary.*

The paper was easy, but, with a few exceptions, was nevertheless very badly answered.

ILLUSTRATED GUIDE TO HOUSE FURNISHING

GRATIS AND POST FREE.

SPECIAL ILLUSTRATED PRICE LIST OF CORONATION DECORATIONS POST FREE.

The knowledge of geometry and its application was generally very poor. The question in mechanics was largely ignored, and when attempted was generally ill answered. The arithmetic leaves much to be desired, and the draughtsmanship as a whole was indifferent. The examination was disappointing; there is nothing which the young carpenter should know more thoroughly than geometry, but this was the weakest feature of the candidates' work.

We have been unable to discover any general indication of sound teaching in any particular.

#### Ordinary Grade.

The paper was not exceptionally difficult, but was a fair test of a wide field of questions, of which little more than one-eighth (eight out of thirteen) was fixed as the maximum to be attempted.

Where the candidates failed they were very bad, but of the 10 per cent. who passed the majority passed well, and showed that they had been thoroughly taught. An examination of the answers of those who failed seems to show that the majority were very badly prepared. Their drawing was poor, and their knowledge of matters connected with carpentry was typified by the answers to question 1. Yellow deal, which is the timber most commonly used by carpenters, was indescribably confused with yellow pine, and astonishing ignorance was displayed of its market forms and source of supply.

Some want of intelligence was shown in answering question 12 (a trussed partition) even by those who gave good answers to question 7 (a mansard roof) and question 13 (a king-post roof). The questions could be answered by any one possessing a fair knowledge of the examples in an ordinary text-book, but the principles involved cannot have been realised. The ability of candidates to cram from a text-book while quite failing to apprehend the principles of construction is a constant difficulty.

Question 5 (forms of mouldings) was rather unaccountably badly answered. The forms required could have been found in text-books, but possibly the knowledge of geometry required was too much for many candidates.

#### HONOURS GRADE.

##### (Written.)

The work done by the candidates for honours was, generally speaking, neatly executed. In the great majority of cases the

drawings were well and clearly done, and showed a familiarity with the nature of working drawings and the mode of illustrating constructive carpentry and joinery by means of such drawings. The answers in writing were as a rule clear and suitable.

This examination, like others of the same class, requires, in order that a candidate may succeed, two distinct sorts of qualification, that of the practical craftsman and that of the draughtsman or clerk, and it has occurred in several instances that candidates who have shown considerable aptitude with the pencil have done but very indifferent practical work, while there have been others who have shown themselves good joiners when working at the bench, but who have been unable to obtain good marks for written answers and drawings. Those who are recommended to pass in honours are candidates who have done creditably in both parts of the examination. Those to whom medals have been awarded are candidates who have gained exceptionally high marks in each part.

The course of the examination has shown that even men well acquainted with the subjects of examination as taught in text-books, and perhaps as practised in the workshop, are not in many instances trained to use their judgment as well as their memory. In more than one of the questions there was a condition or a limitation such as constantly occurs in real work, and for which some provision had to be made in working out the problem. It unfortunately proved in a very considerable number of cases that the candidate either omitted all care for that provision, or else failed to read it in the right way, and this seems to show that there is considerable risk, especially in class tuition, that students who may acquire a good deal of knowledge are not being taught how to turn that knowledge to account in the actual work of life. To illustrate what is meant, we may take as an instance one of the problems set in the present examination. This was to draw the centreing for an elliptical arch, with the condition that such centreing must be supported from the piers from which the arch would spring, in other words, must be supported only at the ends. This question was tried by many candidates and successfully answered in not a few cases, but in too large a proportion of cases the centreing was so drawn that it would not have supported the load it had to carry unless supported in the middle as well as at the ends; in other words, the candidate had not had the intelligence to make such differences in the usual design of this simple piece of carpentry as would fit it to fulfil the conditions laid down. A similar condition

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

existed in one of the questions about joinery, and was neglected by a large proportion of the candidates, with the result that one after another drew with great care and pains a piece of framing which was perfectly useless for the very simple purpose which it was meant to serve. If the candidates could learn to think about the work set them a little more intelligently we should not have to regret that good work is frequently disfigured by glaring mistakes of judgment such as we have had to point out in this report.

#### Practical Work.

The choice of specimens for examination was, on the whole, very satisfactory. There were very few tiny models of roofs and other large pieces of carpentry this year, and even these were generally accompanied by good-sized details of the essential parts. There was some very good craftsmanship shown, some of it as good as could be possibly obtained. The whole, both in selection and quality, was a remarkable improvement on the work of bygone years.

The practical test was by no means so uniformly well carried out as the specimens might have led one to hope. A large number gave very good indications of ability. Some were both very skilful and quick in the execution of the work. In many cases, however, it was only too apparent that men were not such good craftsmen as their specimens would appear to indicate.

#### BRICKWORK.

##### (Written Examination.)

In the ordinary grade papers we were glad to find some very intelligent answers, and, generally speaking, the results were quite up to the standard of past years. The honours papers, however, give us cause for serious complaint; we cannot think that candidates were as carefully and earnestly prepared as they should be for such an important subject, the drawing in many cases being far inferior to that of candidates in the ordinary grade, and in no instance was there a paper worthy of a prize. We notice a tendency on the part of the candidates to use language they do not understand; and that while the theoretical knowledge seems to be improving, the candidates do not appear to understand how to apply it in practice. This would possibly arise from the fact that the practical and theoretical teaching are not sufficiently united.

Greater attention should be paid to the instructions directing candidates to state where their experience has been ac-

quired. This information is of importance, as the character of the brickwork trade varies considerably in different parts of the country, and we are anxious to examine the papers according to local practice.

#### PAINTERS AND DECORATORS' WORK.

##### Ordinary Grade.

The papers are not up to the usual standard, although many of them indicate considerable promise. Some papers show entire want of knowledge of drawing and design. A knowledge is essential to success in the business of a decorator, it is suggested that teachers urge upon the students the advisability of attending a class of instruction in drawing.

##### Honours Grade.

The practical work this year falls considerably short of the standard reached in previous years, although there are on two excellent examples of grained work and a few creditable designs for wall decorators. The designs for panel decorations are mostly very poor. Many examples of graining in represent rosewood as if it were similar to walnut in appearance. The gilding is almost without exception carelessly done. In the designs many students have overlooked the importance of having a contrast between the field and dado.

The examiners recognise the fact that the practical work to be prepared in a limited time at a season when painters are very busy. They would, however, point out that every student has the right to send up examples of his work executed at any time during the year previous to the examination. The marks of this work are compared with the work sent in as answers to the questions, and due allowance is made for the necessary haste.

#### HOLBORN NEW BATH.

THE new bath which has been erected in Broad Street, Bloomsbury, by the Holborn Borough Council was opened Tuesday afternoon by the mayor, Mr. Alderman Phillips, the presence of a numerous assemblage of visitors. The appointments of the new building—which is an extension of the now somewhat antiquated baths in Endell Street, which, it is believed, were among the first to be erected in London and from 1852—are of the latest and most luxurious type. The

THE Latest and most Complete Lists of Builders open and the Lists of Tenders received are given week in the pages of this Journal. The Subscription, including postage, is one annum, or 10/- for six months; or you can have your newspaper for 4d. per week. Published EVERY FRIDAY by GILBERT & CO. LTD., at the Offices, 6-11 Imperial Building, Circus, London, E.C.

contains the bath is 105 feet long by 44 feet in width. The floor of the bath is paved with Venetian mosaic finished in hard marble, with black lines for guidance in swimming under water. These lines, of which there are three or four about 6 inches apart, extend from one end of the bath to the other. The hall is lighted by a continuous line of upright windows. Skylights have been avoided because of the condensation of the atmosphere and the reverberation of sound which this mode of lighting has generally been found to cause. There are hand-club-rooms, and numerous dressing-rooms are provided, with nothing of luxuries for swimmers in the way of spring-baths, chutes, &c. Two large boilers heat the water, which is supplied by the New River Company through a special 6-inch pipe, and supply hot water for the laundries and second-class bath at the older premises in Endell Street.

### BORING FOR WATER IN JAPAN.

The *Indian and Eastern Engineer* is an article by Mr. F. J. Norman relating to what is known as the "Kazusa" system of well-boring, which is adopted in Japan, from which we take the following extracts:—

I should a farmer or householder, living in the neighbourhood where I am now stopping, feel desirous of sinking a well, will send for one of the local well-sinkers, and, after explaining to him for what purpose the water is required, get him to fix upon the spot where it will be best to have it sunk, so the price to be paid. The contract may be a verbal or written one, but it is invariably stipulated—no water, no cash. At this point it is just as well to say that the dowser or well-finder is not an unknown personage in Japan. As a rule the "boss" well-sinker, the owner of the outfit necessary for the work to be taken in hand. To arrive at a correct idea of the monetary value of such an outfit, I suggested to a local well-sinker that he should suppose his house had been burned to the ground, and that all his well-sinking apparatus had been consumed in the flames. I then asked him what sum of money he would require to replace it all. His answer was to the effect that, if he bought a complete and perfectly new outfit from another well-sinker, he would have to pay from 150 to 200 yen, but that this was never done, Japanese well-sinkers take a pride in being able to make everything required for the work, the carpenter tools, the steel crow-bar or rammer, and

the two iron tubes used for removing—one the debris and the other the superfluous water. He then went on to say that with a month to spare, and with a capital of from 50 to 70 yen, he would be able to easily set himself up again in business.

The contract for sinking the well having been made, the boss of the well-sinkers will then collect his gang of workmen, generally consisting of five men beside himself and a boy to run messages and hand things as required. In erecting the necessary scaffolding they use 6-inch timbers and lashings of rice straw rope. A smart gang will put up this scaffolding in about an hour's time; and when all is secure the reel or drum is mounted.

The sides of the reel are made of planks 14 feet long, 6 inches broad and about 1½ inches thick. Six to eight planks aside are required, and exactly in the centre of each is cut a circular hole about 1½ inches in diameter. Through this hole and tightly fitting in it passes an iron shaft, some 4½ feet in length. To prevent the opposite sides of the reel or drum from closing in upon each other, that portion of the shaft lying between them is run through a hollow and somewhat loosely fitting bamboo about 2½ feet in length. The projecting ends of the shaft rest upon strong posts, firmly braced to and supported by the scaffolding. They rest in hollows cut to receive them, and a U-shaped iron spike is driven in over them so as to minimise all danger of the shaft jumping its bed. The outside ends of the planks forming the sides of the reel are kept opposite to each other by pieces of wood about 3 feet long, 3 inches broad and 2 inches thick, let in crosswise. The side planks being spread out like the spokes of a wheel, two bands of bamboo strips are then passed around the reel and over the cross-bars, one to each side of the reel, and firmly tied to the cross-bars. This having been effected there is no danger of the reel collapsing.

The next thing done is to dig a shallow trench inside of the space covered by the scaffolding and immediately under the reel. And should the soil be very soft, it must be lined with matting and have an outlet channel to it to carry off to a lower level all the water and pulpy debris that will later on be removed from the bore-hole from time to time. This accomplished, the work of boring, or as it would perhaps at this stage be more correct to say, of digging, will then commence. A narrow spade, gouge-like in form, some 6 inches across, and with a long wooden handle, will be used at first. When a depth of from 8 to 12 feet is reached, a sufficiently long hollow bamboo or wooden cylinder, not less than 4 inches across the

hollow, is inserted, great care being taken that it shall go down and rest plumb perpendicular. This is very necessary, and the reasons for it are so obvious as to need no explanation on my part. About a foot of the cylinder will remain above ground, and over it and surrounding it will be placed a bottomless tube or box, some 18 inches across. The boss of the well-sinkers then seats himself on a stool opposite this box and well over it, his feet on opposite sides, and facing the reel and scaffolding. From this position he issues his orders and directions, all the while keeping his hand on the topmost step of bamboo, one of the number forming the connecting rod or chain attached to the tools used for mashing up or removing the rods and soil down in the bore-hole. The jar conveyed to his arm upon impact with the bottom of the bore-holes tells him exactly the nature of the substance composing the strata then being worked upon. The method of working is for the gang men to arrange themselves in two or more tiers on the scaffolding, in such a manner as to enable them to handle the connecting rods to the best advantage. They handle this exactly as does the Indian coolie the common road rammer, lifting it up to about a foot to a foot and a half each time, and then letting it down by slackening their lifting muscles, the weight of the cutting or mashing tool and of the connecting rods being generally sufficient to make the required impression on the material of the strata at the bottom of the bore-hole, but should extra force be required the boss alone will give it by a strong downward push or blow. Such extra force is seldom necessary, and avoided as much as possible, for it is liable to cause the couplings connecting the sections of the connecting rods to loosen and perhaps part. This last is a very serious business for the well-sinker, as can easily be realised. While this jumping or ramming operation is in progress, the boy in attendance will every now and then pour a few buckets of water down the bore-hole. In sandy and porous soil this water should be of the consistency of thick pea-soup, made so by having had a quantity of clay dissolved in it. The water is used in order to somewhat soften the material of the rock, &c., down below and so help to reduce it to a pulp, the clay to form a waterproof coating for the sides of the bore-hole, and thus prevent surface and underground waters from draining into it.

The cutting or boring tools are of two kinds, one for soft rocks, clay, gravel, &c., and the other for hard rocks. The first is an iron or steel chisel let into a shaft of hard wood. The second is a two to three inch bar of steel—a crow-bar, in fact. Should it be found necessary to use this steel bar, it is

not attached direct to the bamboo connecting rods, which I describe later on, the reason being that the hardness of metal combined with the very distinct and direct jar conveyed upon impact with the hard rocks below is too much for bamboo, causing it to split in time, and so there is interposition between the two a connecting bar or link of hard wood. The wood most commonly used here for this purpose is what the Japanese call *keyaki*, and foreigners "Japanese teak," the scientific name is *Zelkova acuminata*.

The method of coupling the two is by iron rings or bamboo wedges driven in under them in order to tightly prevent them from slipping. This wooden connecting rod in its turn be coupled to the bamboo rods. The first or bottom bamboo rod has attached to it a short length of wood coupling, some fifteen or eighteen inches in length.

The next tool to be described is the pipe or tube used for removing the pulpy *débris* at the bottom of the bore-hole. It is a 3-inch iron tube, about 8 feet long. At its bottom end is screwed on a short length of another and larger piece of tubing expanding outwards bell-shape wise. Across it and slightly projecting downwards from it, is fitted a chisel or chopper, wherewith to separate and prevent the *débris* from balling, so that it may enter up the tube without difficulty when it is let down upon it in a succession of short ramming downward strokes. Immediately above the chisel is fixed a valve, opening upwards, so that while the *débris* can enter the tube, it cannot well fall out. When the boss well-sinker concludes enough *débris* has entered the tube, he gives the order to lift. The way this is done will be described later. Some 5 feet up the tube there is a square cut hole 3 inches and 1½ inches across. It serves the double purpose of allowing the air and water to escape, and upon the tube reaching the surface permits the workers to empty it with ease by simply turning it upside down. At the top end of the tube and referring to the aperture there is let in a bar or rod of wood; this is made fast to the tube by rivets, and the outward end of it is the coupling connection. From a common iron gas or water pipe can be made a very suitable tube.

Should an excess of water be collected in the bore-hole, removed by a tool similar in many respects to the tool just described. It can be made of lighter metal, boiler iron being good enough, and there is no necessity to have a chisel attached to it.

The bamboo cable, chain, links or connecting rods next to be described. I know not exactly what name to

but they are nothing more or less than long strips of bamboo from 10 to 20 or even more feet in length,  $1\frac{1}{2}$  inches and from  $\frac{1}{4}$  to  $\frac{1}{2}$  an inch thick. The method of joining them on to each other is simple in the extreme. The bamboo cable is extremely strong and supple, and yet sufficiently stiff to permit an effective downward pressure being given should the boss consider it necessary so to can also be easily wound around the reel or drum, for absolutely no danger of its kinking. The winding up on is as novel as it is effective. The way it is done is When the boss thinks it is time to lift out from the bore-rammer or emptying tube, he gives an order to the man above him to "hold on a bit." The ramming being done by one of the men then steps into the reel and commences winding it round and round with his feet by stepping from rung or cross-bar to cross-bar, using his hands on the spokes to both steady and help himself at his tread-mill. Should anyone of the bamboo connecting rods show weakening, it can easily be removed, without interfering with the couplings of others excepting only the two at each end and another one put in to take its place, not more than two to three minutes being required to complete the job, and so it is. The well-sinkers are very particular in examining the rod and joint when winding up, the boss first, and the workmen in the scaffolding above him, and the consequence of this is that accidents seldom happen. When the water-bearing strata is tapped and all the debris is cleared out of the bore-hole, the well-sinker then inserts a series of bamboos joined together, making thus a pipe of sufficient length to line the entire depth of the bore-hole. The bamboos, and most likely so, this bamboo piping would not be very firm in very firm or rocky soil, but it is used here (in London) because little or no rock is met with even when bored to a depth of 720 feet or more. It is much more lasting than I could have believed possible, thirty years being a fair average life for it, or rather of the wells. With the pain and trouble a party of well-sinkers in my presence experienced for me from an old well, and from a depth of about 720 feet a piece of bamboo piping. The term "vegetable" has no longer have been applied to it, for it was nothing more than stone. Now I have no idea to what depths underground white ants will carry their depredations, or if they could not attack a somewhat leaky bamboo pipe with a stream of water flowing through it. Perhaps they perhaps they could not. In the first case it would be

easy enough to circumvent them by having the top joint or two of iron. The bamboos to be used for this purpose must be freshly cut, *i.e.* green, and of not less than four years' growth. They must all be as nearly as possible of the same size, those most commonly used here being from 2 to 4 inches in diameter—inside measurement. The method of joining the various sections of the bamboo piping on to each other is wonderfully simple, efficacious, and expeditious. That is to say, when one has learnt how to do it, and yet it is rather difficult to describe. The first thing to be done, however, is to so arrange the bamboo that the ends to be joined shall be as near as possible of the same size.

Perhaps, and though the water bearing strata may have been tapped, the water will not come to the surface. Should this happen, then a tube will be used. Light boiler iron or zinc sheeting and even stout tin plating are the materials most commonly used for making such tubes. Translated into English these tubes are called "water callers" or "water decoyers," and as their names signify they are used for coaxing the water to the surface. This operation is a remarkably pretty one, requiring great delicacy of touch on the part of the operator, and is conducted as follows:—After the piping down the bore-hole has been cleared of all debris, the "water caller" attached to the bamboo connecting rods in the usual way is inserted carefully and slowly, and upon reaching the water it is pushed down a little way into it and then lifted a little. If this pumping-like operation is done correctly and kept up a sufficient length of time, the water will be gradually and slowly coaxed to the surface.

This having been accomplished, the scaffolding, &c., will be taken down, and should the water be required for drinking and household purposes and the like, two troughs or basins will be built around the head of the well, the one inside of the other and higher.

On the other hand, should the water be only required for irrigation purposes, a trough or tank may or may not be built around the head of the well, but usually only a box, not unlike a dwarfed postal pillar box, will be put over the projecting end of the bamboo piping, the water escaping thence through holes cut under the roof or lid, and spreading itself gradually all over the paddy-field. Should the water, however, be required, to be carried some little distance, this is done in a very similar manner to that in vogue in India. But at times a bamboo piping is used for this purpose, especially if the distance be somewhat great.

ROAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

### INSTITUTION OF ELECTRICAL ENGINEERS.

THE Dublin branch of the Institution of Electrical Engineers held their annual meeting in the Royal College of Science, Stephen's Green, on Monday evening. Professor Barrett, F.R.S., occupied the chair, and there was a good attendance.

The sessional report, which stated that the membership had been increased from fifty-eight to sixty-seven, was adopted on the motion of Professor Barrett, seconded by Mr. G. F. Pilditch.

Professor Barrett announced the names of the new committee, and introduced the new chairman, Mr. J. W. Towle.

A vote of thanks was passed to the Council of the Royal College of Science for allowing the meetings of the Institution to be held on their premises.

An interesting paper on "The Lighting and Driving of Textile Mills by Electricity" was read by Mr. Marshall Osborne.

Mr. Osborne, after discussing the electric lighting of textile mills, said the application of electric power to the operation of textile machinery had not made much progress in this country. The most important advantage of the electric drive was the fact that with it it was possible to concentrate the whole of the power required for operating an extensive mill or collection of mills scattered over a wide area into one central power plant. By that system great economy in working cost, maintenance and staff was obtained. In the case of a single mill very material advantages could be demonstrated in favour of the electric drive, as a large amount of shafting and belting could be dispensed with. In the electric system, also, the necessity of power-wasting devices, such as extra belts, cross-belts, bevel-wheels and gears for the application of power where it was exactly required was entirely obviated. Some of the principal advantages of electric driving, briefly stated, were subdivision of the various points of application of the power, thus reducing the liability to breakdown and stoppage; subdivision of the various floors and sections, so that any floor, section or group of machines could be operated independent of any other floor, section or group for overtime or nightwork; short lengths of shafting, insuring perfect alignment, and thus saving in friction losses; improvement in the general lighting by the removal of a large percentage of belting; saving in first cost of the equipment of the mill both in the cost of buildings and shafting; extreme flexibility of the system, enabling a mill to be erected in any position relatively to the

power operating it, thus insuring that the mill was erected in the most suitable position from the production standpoint. The electrical system not introducing any limiting factor would probably be the case with the mechanically operated mill; any extensions or alterations required could be made without interfering with production; the depreciation maintenance charges were very much less in the electrical system than in the mechanical.

A discussion having taken place on the paper, the meeting ended.

### DO SKYSCRAPERS PAY?

THE economic aspect of the unrestricted construction of skyscrapers, says the *Architectural Record* (New York), is a matter which has ever received very serious attention.

It has been generally assumed that, however they may mar the appearance of a city, they are undoubtedly a great business convenience, and a fertile source of real estate values. Henry James somewhere calls them the "triumph of commerce and the despair of art," or words to that effect. But in the light of certain recent developments of skyscraper economics in New York and elsewhere, we are justified in putting a question mark against this commonly received opinion. The "skyscrapers" undoubtedly pay their owners, just as property pays the protected manufacturers; but, quite apart from the effect upon the looks of a city, or even upon public health, there is a very doubtful matter whether their practically unrestricted construction, so far as height is concerned, has been of general economic benefit to New York city.

From the point of view of the majority of the property owners, it can be conclusively shown to be a drawback rather than a benefit. The erection of tall office buildings makes the concentration of business in small specially-favoured localities, such as that within a radius of 400 yards of the Stock Exchange. A limitation on the height of such buildings on the other hand, would make for the distribution of business over a larger area, and the consequent distribution of the real estate value created among a larger number of property owners. The effect of the distribution of business would be to diminish the cost of real estate on certain streets, such as Broadway, Wall Street and Broad Street, and to increase the value of other streets a little further away. Assuming that the

of business would be transacted under a regulated as an unregulated system, this business would require, of a larger number of smaller buildings, and the augmented demand for space all over the city, caused by the use of sites for a larger number of buildings, would bring pretty general increase of values. Moreover, it would increase the amount of rentable space within the city advantageous localities as much as may be supposed because the owners of eighteen and twenty storey buildings have found it necessary in a great many cases to use adjoining property in order to protect their light and this is true in the case of the Mutual Life, the Washington Park Row, the Commercial Cable, the Atlantic the Singer and many other buildings in New York and the result is that many very well situated parcels of land are withheld from improvement, which in case there is a limitation of the height of buildings to eight or nine storeys would have been most assuredly improved. The value of property so withheld varies in different streets, but on the whole, it would amount to as much as a fifth of the space occupied by the tall buildings.

On the point of view of business interests involved, it is perhaps, so easy to make out a good case for regulation. The advantages of wider distribution of office buildings in some cases make no difference at all; and in all cases would be partly neutralised by the constant use of the telephone, and an efficient system of surface transit. It is probable that a legal restriction as to height would increase the rents in buildings very favourably situated in the Wall Street district of New York, because the business men, bankers, their lawyers and their clients needs a transaction a good deal of running about, both by car and clerks, and an office which reduced the amount of travelling to a minimum would naturally possess increased value. It may be doubted, however, whether increased rents would occur in any except the Wall Street district, and in any case a deduction should be made on the account of the enormous bills for electric lighting which the "skyscrapers" cause the tenants of the lower floors on the streets downtown. On the whole it is questionable whether, after all allowances are made, business in Wall Street anywhere could not be conducted as economically and as profitably in eight as in eighteen-storey buildings.

In view of all these considerations which make the economic advantages of "skyscrapers" at least extremely doubtful,

except to the owners of very advantageously situated property, why is it that there has been no more persistent and successful attempt to bring about such regulation? For if their economic advantages are doubtful their æsthetic and sanitary disadvantages are manifest and serious, so much so that abroad there is no question about keeping the height of all buildings down to such a level that they will not deprive the street of too much sunlight or be too much out of scale with its width. The explanation in general seems to be that in America private and special interests always have more energetic and insistent advocates than the wider public interests. Even Chicago, where a limitation of height to ten storeys has prevailed for a good many years, could not stick to its guns, but has recently given the favoured property owners their own way. It is not easy for a common council to resist men who declare that in case restrictions are removed they are prepared immediately to spend 20,000,000 dol. in new buildings. As for New York, in spite of its claims to metropolitan eminence, it has always been as clay in the hands of the real estate owner and speculator, and the consequences of this let-alone policy, which in another direction has cost the city so much in the way of alienated franchises, are in this matter both irremediable and disastrous. They are irremediable, because to establish a limitation at the present time, after so many "skyscrapers" have been erected, would be an unfair discrimination against other unimproved property in the favoured neighbourhoods, and they are disastrous, because the cost of curing the congestion which these "skyscrapers" will eventually cause is incalculable. This is an aspect of the matter which is too frequently overlooked. If during the next twenty-five years there are continued to be erected an unlimited number of from twelve to twenty-storey buildings on the narrow streets and infrequent avenues of a city, badly planned as they are for the distribution of traffic, the outcome will be a congestion of street traffic and transit of which the Brooklyn Bridge at present gives some inkling, and when this time comes the remedy for this congestion will be as expensive as its perpetuation will be intolerable. It stands to reason that if very tall buildings are erected in large quantities upon streets that were laid out only for very small ones, and if steps are not early taken to adjust this street system to the increasing demands which are being put upon it, this combination of energetic private building, with negligent public administration, will do more to damage the business interests of the city than any amount of restrictive regulation.

## AN INDIAN CANAL.\*

THE Chenab Canal was originally constructed as an inundation canal, to irrigate a portion of the area now commanded. Very shortly after it was opened, it became apparent that however successful an inundation canal may be for riverain lands in which wells can be worked to mature the crops after the river falls and closes the canal, it is quite unsuited to the needs of the high lands which form the Rechna Doab. The canal silted heavily in the flood season, and as there was no means of forcing the water over the deposit, or of scouring it out, the water ceased to flow before the *khari* or rains crop was matured, and before watering had been given to allow of the ploughing necessary to sow the cold-weather crop. The responsible engineers at once agitated for a weir across the river, so as to raise the low water-level and make the canal perennial. This was sanctioned in 1888, and as it was obvious that the full value of that work would not be obtained unless the whole of the high land was brought under irrigation, an estimate was sanctioned in 1892 for extending the original canal as now shown on the general plan. The enlarging of the canal was an engineering work of no small magnitude. The construction of the new branches and distributaries was no more difficult than the original canal, but the main canal had to be widened from a channel 109 feet wide, carrying 7.6 feet of water, to one 250 feet wide, and carrying, as has been said, 10.8 feet depth. All the bridges had to be rebuilt, the channel itself regraded with falls introduced, and all this had to be done while the canal was still flowing and irrigation was developing. The funds and labour available were concentrated as much as possible; thus one division was employed in widening the main canal, while another constructed the Jhang Branch Upper. As it and its distributaries were completed, it was opened for irrigation, and work was commenced on the Bhawana branch and Jhang Branch Lower. When these were ready colonisation operations began on them, while the engineering staff was transferred to the Gugera Branch Upper and subsequently to the Gugera Lower and Burala Branches. Thus, as soon as any section of the canal was ready, it was opened, and began after the first year of remissions to earn revenue. The project estimate con-

\* From the paper on "Recent Developments in Punjab Irrigation," read by Mr. Sidney Preston, C.I.E., at a meeting of the Indian Section of the Society of Arts.

templated that the full capital would be expended by the year 1899-1900, and that the irrigated area increase from 39,300 acres in 1889-90 to 528,500 acres in 1899-1900, to 993,000 acres in 1909-10, and that the mate development of 1,100,000 acres would not be until 1914-15. What have been the actual results of the weir was completed in the spring of 1892, and at once served by it, with the result that in the year 1892-93 157,197 acres were matured. The subsequent development was as follows:—

Years.	Acres.
1893-4	270,400
1894-5	269,300
1895-6	369,900
1896-7	520,200
1897-8	810,000
1898-9	957,700
1899-1900	1,353,200
1900-01	1,828,800

while in the current year the irrigation to the end of had amounted to 1,920,240 acres.

Up to March 31, 1901, a total area of 1,466,125 Crown land had been allotted, while the census taken in the month showed that close on 800,000 souls had been introduced into it. Several towns of considerable size have been founded, Lyallpur, so called to commemorate its foundation by the Lieutenant-Governorship of Sir James Lyall, now from 8,000 to 10,000 inhabitants, while Sangla, Gojra and other towns are progressing rapidly, and are large markets for the export of the produce. The villages have been laid out on a uniform and sanitary plan, and are rapidly springing into existence all over the whole tract. It may, I believe, be prophesied that this canal will in time irrigate as much as 2,500,000 acres in the year, raising crops which may be valued at 5,000,000 sterling. You may be interested in hearing that this scheme has cost, and the return Government is to obtain from it. The original estimate amounted to 256,800 for a canal to discharge 8,333 cubic feet per second, which it was estimated would ultimately irrigate 1,828,800 acres in the year. To the end of 1900-1 the total cost of 252,63,656 rs. had been spent on a canal which carried 10,800 cubic feet per second, and in that year 1,828,800 acres of crop, and is still undeveloped. It has already stated, be said to be certainly able to irrigate 2,500,000 acres when possibly another 20,00,000 or 30,00,000

on it. In 1900-1 the net revenue assessed gave a return of 18.18 per cent. on the capital, but this is allowing for remissions already mentioned, and it has been calculated that if the area actually matured had been assessed at the same rates (which are by degrees coming into force), the revenue, after deducting working expenses, would have yielded a return of 24.58 per cent., and as the Indian Government can, I believe, borrow money at  $3\frac{1}{4}$  or  $3\frac{1}{2}$  per cent., it is an eminently satisfactory investment. It must not, however, be thought that this high return is obtained by over-irrigation or grinding the cultivator. The crops matured in the canal in 1900-1 are estimated to have been worth 9 rs. Of this Government only took between one-eighth and one-ninth, leaving the large balance of 447,16,325 rs. for the cultivators. If further evidence of the fairness of the assessment is required, it will be found in the crowds of people flocking to the land which surround every officer during his tour of the Punjab, although the amounts of the assessments are well known.

There is one other point to which I should refer before I conclude my remarks with regard to the Chenab Canal. You may perhaps wonder how the distribution of the water is so arranged as to insure its reaching the millions of fields into which the vast area is divided. When the supply in the river is sufficient for the full supply of the canal, this is a comparatively easy matter. If the demand warrants it, the canal is run full, which, in turn, gives full supplies to all the distributaries. The difficulty really begins when the supply falls below the requirements, and it is then that the skill and intelligence of the canal staff are taxed to insure an equitable distribution, and to mature as large an area as possible. Of course, this is more difficult in the cold weather. Still, taking the case of the Chenab Canal, the river usually remains fairly full from the middle or end of October; this gives ample supply for winter sowings. Should the cold weather rains fail, the supply will be entirely dependent on the canal, while the discharge of the river will probably not exceed 100 cubic feet per second. If the water were available it is probable that the canal would be run full more or less steadily, but in the present state of things, the whole volume of water is passed into the canal and distributed to the various branches in rotation. Some years ago the system was to distribute the supply between all the branches, each steadily with the share of the supply available. It is obvious that with this system the distributaries

could not run full; with the result that lands which were high did not receive water, the depth in the channel not being sufficient to flow on to these high lands; the water was drawn off by outlets serving low lands in the middle reaches of the distributaries, and little or none reached the tails, with the result that there was heavy failure of crops in the tail villages. This has now been altered, and the reduction necessary is made in time instead of in volume. Thus every distributary when opened at all is run full, so that all the outlets on it work fairly and as designed, and the tail villages now obtain as good a supply as those at the head.

When any given distributary has received its allotted time of full supply it is entirely closed and the water passes into others. The art of good administration lies in correctly fixing the periods for which each distributary is opened so as to utilise to the best advantage the supply available, and to take advantage of any freshets which may come down the river owing to rainfall in the catchment area of the river above the weir. Thus the system must be so designed that if to-day 4,000 cubic feet are being received, we can to-morrow distribute 8,000 or even 10,000 cubic feet if that volume reaches the canal head. To do this it has been found necessary to have a private telegraph line extending all over the system, so that every officer and subordinate may be at once informed what volume is available and which channels are to be opened. The new system has also the enormous advantage of economising water, as the shortest length of channel is kept wet, and consequently the loss by absorption and evaporation is reduced to a minimum.

I have only one more remark to make before I leave the Chenab Canal. Very early in its history it became evident that a railway to remove the produce was absolutely necessary, and the canal and revenue officers agitated for its immediate construction. This requisition came on the railway branch of the Public Works Department unexpectedly; such a line had not been contemplated in the programme then in operation, and it was some time before funds could be made available, and the line from Wazirabad to Multan, passing through the length of the colony, constructed. It is not too much to say that the colonisation scheme was within an ace of proving a failure from the impossibility of the colonists getting rid of the enormous quantity of produce, and raising cash to pay the Government demand. This had now been so fully realised that, in the case of the more recent Jhelum Canal, a similar railway is now being laid down in the centre of the

### DEATH OF MR. JOSEPH TANGYE.

THE death is announced as having taken place on the 28th ult. of Mr. Joseph Tangye, late of the firm of Tangyes, Ltd. For the following particulars of a notable man's career we are indebted to the *Birmingham Post* :—

When the Crown lands at Bewdley came under the hammer, about thirty-three years ago, Mr. Joseph Tangye, of Birmingham, became the purchaser of the once royal abode at Ticknell. From that time he has been a resident in the ancient borough and interested himself in its fortunes. He eventually left Ticknell (which he had restored) for the residence he built for himself known as Hern's Nest, and here he passed away at the ripe age of seventy-five years. Mr. Tangye's career has been a very remarkable one, and the way in which he came to the rescue when Brunel's *Great Eastern* stuck in the mud in the Thames lifted him and the firm with which he was identified to a pinnacle of fame in the engineering world. Most Birmingham people know that the Tangyes are of Cornish origin. Mr. Joseph Tangye and his brothers, however, though born in Cornwall, all in the end found their way to Birmingham, where they breasted their way to the position which Tangyes, Ltd., now holds. We are informed that Mr. Joseph Tangye had not the advantages of much education as a boy—it was not the days for this—but he applied with zeal as a youth to the acquisition of technical and mechanical knowledge, and even in his early years was able to render service with that knowledge. It was about fifty years ago that he came to Birmingham and started with a single lathe in a little upstairs room near to where Messrs. Elkington's establishment now is. His brothers also came to Birmingham and started in business, and eventually they all joined together. Brunel, when in difficulties from the failure to get the huge *Great Eastern* afloat, heard of the Tangyes as men likely to be of service, and sent a representative down to Birmingham to see them. This gentleman thought the modest works he saw could not be those of the engineers calculated to help Brunel, and it is said that he went elsewhere to make inquiries for the Tangyes. In the end he

came back to their place, though altogether doubtful as to the possibility of rendering service. When Mr. Joseph had the matter explained to him and knew what he wanted he said it could be done and should be. Hydraulic power was supplied in sufficient quantity to get the *Great Eastern* at last into the water. The achievement gave the Tangyes a name among the engineering firms of the world which they know, and their reputation was recognised everywhere. At that time the works of the firm have grown till they employ between 2,000 and 3,000 workpeople. Mr. Tangye, when he settled down at Bewdley, took his engineering with him, and had a fitting shop at his successive residences there, where he spent much of his time in engineering and was often devising something new. He took a considerable interest in the locality where the later years of his life had been spent, and was ever ready to give of his benefit of his mechanical genius and advice. He left a widow and several sons and daughters.

At the monthly meeting of the Liverpool City Alderman Salvidge drew attention to a report from the Mayor relating to a stoppage of work in which some of the Corporation contracts were affected. In the epitome it was mentioned as a stonemasons' strike. He wished to say that this was a strike but a lock-out. He understood there was a great deal of work going on at present with reference to the Corporation, and a large number of men had been employed to carry out the work. He also understood that the master masons had given the men certain alterations as to the conditions of work, but was not believed, did not affect the question of pay at all. As the lock-out brought about by the masters themselves he maintained that it was a matter for inquiry, and the legal question ought to be placed before the Council and some attempt ought to be made to get the master masons proceed with the work. Corporation contracts or come to some arrangements with the men on the matter. He was told the men were prepared to submit the whole of the matters in dispute to arbitration, and was resolved that the matter be inquired into by the committee.

## THE WEEK.

WHEN Queen Victoria Street was constructed it was generally believed that the houses in it would exemplify the most advanced type of safe building. The terrible tragedy which was enacted in so important a thoroughfare on Monday afternoon on that account has excited unusual horror. It seems incredible that in the centre of the City of London, close to the Mansion House and the principal fire-station, in broad daylight, eight human beings should be consumed almost before the eyes of thousands of spectators. It was only, however, another instance of the inefficiency of our public and social organisation when put to the test. A witness at the inquiry into the latest of the Barbican fires expressed the opinion that the Metropolitan Building Act is extremely lenient to builders. It would have been more correct to have said building speculators. It is possible to erect buildings which, if not irresistible to a continuous fire, can at least withstand the power of the flames during a time which will be sufficient to enable the best fire brigade to arrive on the scene. But in Queen Victoria Street we find that not only the contents of the shops were destroyed, but the floors and the stairs also, in an amazingly short time. What is equally remarkable is that no less than five houses appear to have been almost simultaneously more or less affected. It must therefore be readily admitted that the construction was at fault, for it seems to have been as flimsy as in any jerry-built terrace in the suburbs of London. A circular wooden staircase, it is said, merely as a funnel.

ALTHOUGH the fire commenced when all parts of the building were occupied, it is incomprehensible that not one of the occupants of the offices or representatives of the employers brought information to the firemen in the neighbouring Watling Street. In such a crisis every second was important, and yet, at least ten minutes were allowed to elapse before notice was sent to the station. Queen Victoria Street is never without policemen, and it would not be an excess of duty for one of them to have given the alarm. The firemen turned out as quickly as was to be expected from a station that to all appearances was not planned to deal with emergencies to be met. They might, however, with almost as much advantage have remained in Watling Street. Harmony does not exist between the Common Council and the County Council, and one effect of it is seen in the surrounding fact that no fire escape is provided which corresponds with the height to which modern buildings in the City are now commonly built. Fifty-foot escapes are almost obsolete unless it can be guaranteed that no fire can arise in the upper storeys of City buildings. It was necessary to send to Southwark for a long ladder, and by the time it was set up the tragedy was all but completed. On such occasions it is commonly assumed that policemen on the spot who are competent to devise an impromptu system, but it appears that if it were not for the accidental presence of a provincial and amateur fireman the utilising of tarpaulin would have been neglected, and the death list would have been increased. The municipal organisation of London has, in a word, flagrantly displayed its weakness on the occasion.

UNHAPPILY responsibility has to be shared by others. There is no doubt the building was used as a factory, whether legitimately or not has yet to be revealed. By the County Council the excuse was made that the house was a new workshop. Granted; but where was the provision for escape on all the storeys above the ground floor? Notice in writing specifying the means of escape that were necessary and ordering them to be provided served on the owner or owners of the factory, or was there any provision to have the works required carried out by the London County Council? All these are demanded by the respective clauses of the Factory and Workshop Act of 1891. To say that no particular attention had been called to the building is an excuse unworthy of the County Council, with all its deficiencies. We have several times pointed out the danger of buildings which pass for fac-

tories, and as many have thought expressed ourselves with too much severity on the supineness of the authorities in regard to them. But the loss of life on Monday in the heart of the City should demonstrate to all that a long course of *laissez-faire* policy is likely to be followed by similar scenes in the Metropolis unless more energetic action is determined upon by the County Council. The misfortune is that when a fire breaks out individuals will only trust some elected authority. In the majority of cases means can be provided by house owners which are more efficient than any aid which can be rendered by authorities. It should, in fact, be recognised that all that can be done by corporations, whether public or private, can only be supplementary to the precautions which people should adopt who have to consider the lives of others. Factory owners and employers in general, as well as the proprietors of schools and of buildings in which people assemble, should regard it as a duty to make themselves independent of such assistance as failed to be of any service in Queen Victoria Street on Monday. Fireproof construction ought to be far more frequently employed than it is at present. Of late years it is true that some gentlemen who have assumed the office of judge have cast doubts upon the efficiency of some of the arrangements in use. By all means let improvements be introduced, but it is unquestionable that if the house in which the fire broke out on Monday exemplified any of the established systems of fireproof construction the loss of life could not have occurred. Walls and partitions as well as floors can now be made sufficiently safe. There are also many aids and appliances which serve for extinguishing a fire before it has assumed great force. They should be compulsory in buildings which are occupied as offices or workshops. There are, too, means of escape which are extremely serviceable, and which are not difficult to employ. In fact, any self-reliant man who will make inquiries can easily find out a great number of inventions which are obtainable at a moderate expense, and which are adequate to safeguard life unless under extraordinary circumstances. But so long as people will confide solely on the arrangements which are supposed to be made by authorities, and about which they can have no certainty, tragedies like Monday's cannot be avoided. According to all reports, there was not the least preventative existing in the fatal building, and not one inmate appears to have rendered the slightest service. So far as is known, the unfortunate girls were allowed to meet their death without the smallest exertion on the part of any of the occupants, for the male assistants precipitately escaped from the building at the first rumour of danger.

FROM the decision which was given by the Court of Appeal in *DUNHAM v. CLARE*, it would appear that an accident which only indirectly or remotely was the cause of death, is, under the Workmen's Compensation Act, to be regarded as if it were a direct cause. In last September a man when carrying a pipe slipped and injured one of his toes. A fortnight after the accident erysipelas set in, and in the course of twelve days he died. His medical attendant ascribed the death to blood poisoning caused by erysipelas of an uncommon form. Medical evidence was given to the effect that erysipelas was a very unusual consequence of such a wound. The County Court judge decided that as death was not the result of an accident the widow was not entitled to compensation. In the Court of Appeal the Master of the Rolls relied on the first section of the Act, viz.:—"If in any employment to which this Act applies personal injury by accident arising out of and in the course of the employment is caused to a workman, his employer shall, subject as in hereinafter mentioned, be liable to pay compensation in accordance with the First Schedule to this Act." His Lordship held that to inquire whether death was the natural or probable consequence of the accident was to apply a wrong standard. The question was, did death result from the accident or was the chain of causation broken by a *novus actus interveniens*, which gave a new origin to the after consequences? In the case before the Court death was the result of the accident, unless some new cause had intervened, and nothing had intervened to substitute a new cause. The appeal was accordingly allowed, and compensation will have to be paid.

## MEMORIALS OF VICTORY.

WE referred last week to the indifference commonly evinced in this country about architectural or sculptured memorials of the successful wars in which Great Britain was engaged. To some extent the absence of those signs of national glorification is warranted by ancient precedents. The Greeks, for example, were proud of their victories in war, and they were not averse to slaying or converting their foes into slaves. They also knew how painful could be the sight of enduring reminders of defeat, especially when the people who were one time enemies afterwards became allies. There was accordingly a compromise between states on the subject, which denoted primitive courtesy. The erection of a memorial or trophy of a battle was allowed, but in order that it might decay quickly timber alone was to be used instead of stone or metal, and all repairs were prohibited. It could in that way have only temporary importance. As a consequence the memorials of victories among the Greeks were always limited in number. The Greeks were not alone in preferring historical or poetic records to constructive works as a means of informing posterity about their contests. The circumstance that no great monument was to be seen which recalled the triumphs of ALEXANDER THE GREAT, suggests that in states which were less civilised than Greece no ostentatious elation was taken in the triumphs of war. Then as now fortune was known to be fickle, and the sight of a pompous monument, it was believed, might act as an incentive to fresh wars in the hope of attaining a reversal of the former issue. Although the world has advanced in many ways, people continue to be sensitive about the existence of anything which brings back to the memory a failure. All the philosophy of the Germans did not prevent them in 1870 from having a strong desire to destroy the Bridge of Jena and other structures in Paris, which signalled defeats by the French army under NAPOLEON and subsequent brutalities by the victors. They were only imitating their ancestors, for TACITUS relates how the Germans of his time appeared to be more mortified by the erection of a Roman trophy than by the loss of many of their bravest tribesmen, and they seized the earliest opportunity to overthrow every stone which recalled their loss of liberty.

When great artists arose in Greece all occasions which offered themselves were employed to display their talents. The old indifference to trophies was overcome. The beautiful statue of VICTORY which is in the Louvre would not be so perfect if several sculptors had not made experiments in the creation of similar figures. The Dorians were peculiarly callous about the feelings of their adversaries, and as far as can be ascertained they contrived to have memorials which were not always of perishable components. In the time of PAUSANIAS many of them must have continued to exist, although at present no remnant of them is to be traced. From what is said by the topographer it is evident there was some apprehension about the danger of indulging in the pride of success, for the memorials were often dedicated to deities. The Romans had more of the Doric than of the Attic spirit, but at first they avoided the setting up of trophies. Then as they grew in power they made no scruple about displaying memorials of victories not only in Rome, but in the neighbourhood of the battle-fields. They believed that such monuments would have a deterring effect on the people who were subjugated, besides serving as historic records. With all their greatness the Romans never cared about concealing their worth. Their houses were adorned with arms which were won in battle, and out of the superfluity the public buildings were decorated. Then it was found that sculptured representations were as serviceable as breastplates, swords and bucklers. The memorials assumed many forms. One erected by POMPEY in Spain was considered to be among the wonders of the world. At La Turbie, in Monaco, there are still the remains of the trophy which was constructed after the battle of Actium, and of which a colossal statue of AUGUSTUS formed a part. The ruins of the tower show that it was 100 hundred feet in diameter and was approached by a flight of steps from a square platform measuring 130 feet.

The last work is evidence of a change in spirit. It was no longer Rome which was glorified, but an individual. Afterwards a surprising number of arches and columns

came into existence which were devoted to the preservation of the renown of the Emperors. Among others may be mentioned the arch of CONSTANTINE in Rome, which was inscribed to him as "the founder of peace and the deliverer of the city." The fronts of the arch became a field for the representation of events of which the Emperor was the hero. In the arch of TITUS the reliefs displayed not only his prowess on earth but his ascension towards the heavens. The arch of SEPTIMIUS SEVERUS also represented the Emperor's conquests, although the subjects cannot now be clearly understood. The columns of TRAJAN and MARC AURELIUS were also conceived in a like spirit, which was the exultation of Imperial power. In the provinces similar works were constructed. The arch of TRAJAN at Benevento must have been equal as a work of architecture and sculpture to any of those at Rome. Another arch, which some critics believe to be the finest example in the world, is at Ancona. The arch of AUGUSTUS at Rimini is also a notable work, but it recalls Peace rather than War, for it was dedicated to the Emperor as the chief road-maker in Europe.

Although VICTORY as a personification was known to the Greeks, for they imparted human attributes to many things, it received more of the honour due to a goddess from the Romans. It seems, however, to have been difficult to decide the proportion of the honour paid to VICTORY as a goddess and to the Emperor she guarded. That great respect was long offered is evident when it is found that St. AUGUSTINE mentions VICTORY as the queen of the gods and the representative of JUPITER. VICTORY was often employed on the reverse of coins, and continued to be utilised down to a comparatively late period. In that way Roman pride was domesticated in all lands then known.

Warlike memorials were identified as productions of the Romans beyond any other people. When Roman power was at an end wars did not cease, but it is remarkable that however victorious, other races never followed the Roman manner of celebrating the infliction of defeat. Mass buildings equal to the old triumphal arches were sometimes made to flank the entrances to cities in Mediæval times, but they were intended as defences or as toll-houses. Even Venice was satisfied with recording its triumphs on land and sea by means of paintings. The old tradition was taken up until the seventeenth century, and by the people who claimed to be allied to the antique Romans. In 1608 the Porte Saint-Denis in Paris was constructed from the designs of FRANÇOIS BLONDEL. It was to commemorate the victories of LOUIS XIV. in Flanders; the sculptured upon it has consequently a military character. Twenty years afterwards the Porte Saint-Martin was erected according to the plans of BULLET, one of BLONDEL's pupils. Neither work can be considered as more than a weak imitation of Roman examples which were devoted to individual rulers rather than to an army. NAPOLEON when his turn arrived, was too politic to ignore the fact which brought him to power. In the triumphal arch at the Place du Carrousel, constructed from FONTAINE's plans, which were inspired by the arch of SEPTIMIUS SEVERUS in Rome, reliefs were introduced in which no doubt the Emperor was the chief actor. But when the eight figures of types of the French army in 1805 were set up at a late time, it was understood that the Emperor's original idea was realised. That is no doubt a disputed point, but there is no question that when by his decree he ordered the construction of the Arc de l'Etoile, he was thinking of the whole history of the revolutionary army. The names of about four hundred generals are inscribed on the stones, and the great reliefs are not all illustrative of NAPOLEON's victories. In magnitude it surpasses any Roman example, and although the summit of it is still without a crown, a masterpiece of sculpture, the structure is a worthy memorial of the events which took place in the twenty years which followed the Revolution.

We suppose the triumphal arch which used to stand opposite Apsley House and supported the wonderful equestrian statue of WELLINGTON has a claim to be regarded as having some connection with the Duke's campaigns. But no stranger who now sees it could credit it was ever a warlike character. DECIMUS BURTON's arch at the entrance to Hyde Park, with its equestrian figures derived from the Elgin Marbles, and the Marble Arch at the o-

extremity of the Park, which was transplanted from Buckingham Palace, are both so simple they must at once be identified as expressing the peaceable intention of the designers.

If judged merely as records of battle scenes or *Denkmäler*, it is doubtful whether any Roman or French works are equal to the compositions by Assyrian sculptors and Egyptian painters. They show the incidents of a campaign, and although there may be exaggeration and the fighting power on one side is unduly magnified, yet they are more significant than most of the work on the faces of the *Arc de l'Etoile*. RUDE's great relief no doubt is suggestive of the enthusiasm of the Republican soldiers, but it would serve equally well as a representation of a Gallic or Germanic tribe rushing to an attack on the Roman armies eighteen hundred years before the "*Marseillaise*" was chanted.

It is never likely that in England a war memorial will be raised which can compare with one of those in Rome or Paris. We are utilitarians, and if triumphs must be commemorated in stone or brick, it will be in a simple rather than in a heroic form. There is consequently much to be said for the project of erecting memorials of the African contests in the shape of cottage homes for old soldiers throughout the country. It is not creditable to be constantly hearing of the death in the workhouse of brave men who have borne the brunt of more than one campaign and have taken a part in famous struggles. A fairly comfortable building that would accommodate a couple of families could be built for 700*l.* or 800*l.*, and if local rates and taxes must be levied, the interest on 300*l.* would pay for them as well as for ordinary repairs. Triumphal arches, needless in timber and canvas, obelisks and tall columns are out of place in the British Isles, and with regiments which have local designations it seems absurd to testify to their ravery and endurance by one big memorial to be placed somewhere in London. The rank and file of the Army would have some special acknowledgment, and it cannot be a more acceptable configuration than houses which would shelter some of those who have loyally served the country in emergencies.

## DECORATIVE ILLUMINATIONS.

By F. J. WARDEN-STEVENS, A.M.I.M.E., A.M.I.E.E.

THE question of decorations and illuminations has taken an important place on occasions of rejoicing, and especially during the last few years. It is to be expected that all over the country the decorative illuminations for the Coronation festivities will surpass anything that has been seen, the workmen being now busy with the fixing of the more substantial portion of the effects on large buildings.

I propose herein to briefly refer to the considerations affecting the question of decorative illuminations for temporary purposes and the different arrangements that have been or are being adopted.

We may have illuminations the design and fittings of which are far from decorative if viewed in the daytime, but the aim should be to so arrange that effect is not only obtained when illuminated, but that a pleasing decoration is available even when not in use. This may be obtained to some extent by flags, bunting and artificial flowers being intermingled with suitably arranged electric lamps, so that when one is not visible or decorative the other is, and *vice versa*. Such an arrangement is, of course, not possible with gas or fairy lamps, but only with electricity, on account of the danger from fire.

The arrangements required being only of a temporary nature, it is most frequently necessary for the expense to be the first consideration, and I am afraid there have been occasions when the cost has been so curtailed that the arrangements and mode of carrying out the work have been such that the result has been an absolute failure.

The simplest and least costly form of decorative illuminations fulfilling the requirement of effect by day as well as by night is no doubt the coloured-paper Chinese lantern enclosing a candle, but this is of too temporary a

nature—a little rain, a puff of wind, and all is over. There is also the danger from fire, not only to itself, but to its surroundings, and the attendance necessary renders the Chinese lantern a very troublesome and oftentimes, when awkwardly situated, an impossible form of illumination.

The fairy light, in its coloured glass or china bowl, offers a simple and effective arrangement if adopted in sufficient numbers, but otherwise it is insignificant. It also possesses to some extent the defects of the Chinese lantern, for it requires considerable attention and is affected by rain and wind.

Gas is used to a very large extent as being a convenient form of illumination, and many devices are possible to give a decorative effect by night; the sight by day is, however, far from pleasing generally. Plain piping with holes or small burners as outlets for the gas can hardly be called decorative, even when forming such devices as letters, stars, crowns or flowers, and is even less so when simply utilised to outline windows of buildings. It can be improved upon in this direction if coloured globes are utilised to enclose the gas jet.

I have not so far alluded to crystal or transparent devices, which offer a better effect with gas, as the plain piping is obscured from view; these arrangements also offer a form of decoration in the daytime. The great disadvantage with the use of gas, however, for decorative illuminations is the fact that the result is much impaired by wind. The gas torch or flare for illuminations is acceptable but cannot be called decorative.

Electricity certainly offers the greatest possibility of effect both for decorations and illuminations, and I propose to describe the different arrangements for carrying out the work.

A simple form of planning the work is to utilise a twin insulated cable, stapled to the walls as and where required, to give devices or outline windows. To this at equal distances are fixed the lampholders, either coloured lamps being used, coloured globes, or shades; but in order that the effect may be satisfactory by day, it is necessary that the lamps are close together. A special lampholder is necessary to insure water tightness between the lampholder and wire and between the lamp and holder. Such a system as this has been introduced on the present occasion, which is known as the "*Fairyland*" system, and the cable and fittings are made up already for use and sold by the yard, with lampholders in position at distances generally of 12 inches apart, the shades of about 9 inches diameter, of ornamental stamped metal japanned in various art colours, and fixed over the lampholders.

Another novelty consists in a new insulator suitable for fixing insulated wires, the wiring being fixed and strained to insulators at comparatively long distances apart. The insulators are in halves, and the two wires are fixed to galvanised iron clips which slip on the insulator, the top being placed in position, and the whole is fixed by an ordinary coach screw to a plug in the wall. This system is specially advantageous where it is desired to keep the material for future use, as once the wiring is done and the plugs are fixed on the wall the decorations may be carried out on future occasions with little expense and no outlay for material.

A simple system is to use bare copper or galvanised iron wires fixed to insulators, special insulators being available of a simple nature, the lamps being fixed directly to the wires by spring clips. This system is inexpensive and easily fixed, but it does not have the advantage of water tightness possessed by the previously mentioned systems.

A system which has a great future before it for decorative effects is that known as "*Electric-Lighting Boards*." The special advantages of this system are simplicity and variety of design. With regard to the last-named, mottoes may be changed and devices entirely altered without what may be called structural alterations, by simply altering the lamps. Electric-lighting boards appear to be boards covered with easily pierced decorative material, the lamps being affixed by simply being stuck in where desired; no lampholders are required, the cap or base of the lamp having two pin projections. Contact is made under the outer covering with the special conducting material; this material is also made up in the form of flexible strips as well as boards.

There are many simple forms of batten-holders suitable for arranging any device to a board with rapidity, the chief feature being conveniently arranged side clips fixed to lamp-holders, by which they may be fastened by a screw or pin before the wiring is carried out. This method has much to recommend it for use in forming letters or designs of a more or less elaborate nature, and if a board is in the first instance pierced by holes for the wires at regular and close intervals the lampholders may be fixed to form any required design and of course changed with ease at any future time to suit the occasion.

Devices may be cheaply and strongly constructed with "Simplex" tube in a similar way to the method of construction for gas, only there is no screwing, sockets being used. Almost any design may be made by means of the standard bends, tees, &c., and at each lamp a T socket is inserted to carry the holder.

The General Electric Company have many standard designs prepared for this occasion, and it may be said of them that they are very artistic and most effective. They make a specialty of a bright metal background, on which the lamps are placed, and this serves the double purpose of an effective day and night display, and certainly allows of a brilliant night effect with few lamps.

Amongst the special illumination devices, mottoes, festoons, crowns and monograms may, of course, be expected to be most numerous.

Transparent portraits of the King and Queen, with the lamps enclosed behind in a metal box, are obtainable, which are likely to be popular, as also is ornamental scrollwork of metal studded with lamps.

The rose, shamrock and thistle in the natural colours on the Electric-Lighting Boards system should be considerably adopted.

A point worthy of mention is that recently there have been introduced special waterproof elastic varnishes into which lamps may be dipped, and which give any colour or shade desired. This may be removed afterwards by dipping in a spirit, and the lamps put into ordinary use.

Some electric-lamp makers are making a specialty of lamps with portraits of celebrities etched on the glass, and these are very effective in use.

Coming to the question of the supply of the illuminant, the additional demand on the gas companies is met by additional storage and manufacture. With electricity supply the question is somewhat different, as storage is not available to any considerable extent. It therefore means that the companies or supply authorities will only be able to supply a certain demand at one time, depending upon the available plant. Unless spare plant is available or additional temporary plant is brought into requisition, a considerable extra demand cannot be supplied. Of course if the season is one when the ordinary demand is a minimum this is of assistance, and again as shops and business premises will be closed this will also counterbalance the additional demand, or nearly so, in many cases.

Another point is the question of connection. As is known, ordinary electric wiring has to be carried out in accordance with the rules of the supply authority. Now, it can be readily understood that for temporary purposes the same standard of material cannot be insisted upon, and some of these rules must be overlooked also, on account of the extra work which would devolve upon the staff; but, on the other hand, there is unfortunately a possibility of very inferior work being carried out, which to the supply authorities might mean damage to their mains or stoppage of the supply to other of their consumers, caused by formation of a short circuit or "earth" which might also result in fire on the premises.

With this in view, there was recently a meeting of some of the London supply authorities to discuss the alterations in their rules, and the arrangements that were necessary in the case of temporary connections to their mains. Amongst the arrangements agreed to were a fee of 10s. 6d. to be charged for the connection if a service already existed in the building, otherwise the actual cost to be charged, which will be refunded if a general supply is adopted within three months; the charge for electricity to be 1d. per 8 candle-power lamp per night, payable in advance; applications may be refused after a safe limit to plant and mains has been reached; it is also urged that the liability of fire

should be particularly considered with temporary arrangements.

Inquiries were sent to the engineers of electric supply works all over England recently, by the *Electric Review*, as to the special facilities to be offered regarding the supply of electricity for the Coronation illumination, and in the cases of Blackburn, Darwen and Farnworth, it is to be noted there is to be no charge for the electricity for such purposes, while in many cases the ordinary charge may be made.

## NEW BOOKS.

WE cannot in England compete with American Germans or Frenchmen in the production of books on technical subjects. This is owing to an absurd notion which is peculiar to our countrymen. Some among us suppose that the possession of books relating to the profession, art or business implies a want of originality on their part. Strange to say, solicitors exhibit this weakness in a stronger degree than barristers. There may be men like the late Lord RUSSELL OF KILLOWEN who are not strong in cases, but they wish to possess an ample collection of special treatises to refer to whenever an occasion arises. Architects and engineers conceal their want of acquaintance with books by affirming that the pages are not practical. But it is now too evident that the prestige of English construction does not stand so high as it did in the old days when rule of thumb science was thought to be equal to all requirements. It is not gratifying to perceive that the best books of reference on applied science are those of German experimenters, and that many Germans of ability prefer to seek a home in the United States because they know their conclusions on particular subjects will be more appreciated there than in this country. Investigation of the strength of materials is one instance. There was time when belief in the empiric skill of Englishmen was general, but it is now becoming more plain that they must be respected, and to some extent it has been scorned in England.

It is therefore encouraging when we find a book in which theory and practice are combined, like "The Design of Structures: a Practical Treatise on the Building of Bridges, Roofs, &c.," by Mr. S. ANGLIN, C.E., published by CHARLES GRIFFIN & Co., Ltd., has reached a third edition. Knowing the shortcomings of English education the author has been careful to make his explanation capable of comprehension by those who have no more than an elementary knowledge of mathematics. The graphic method is also utilised for their benefit. The new edition has undergone thorough revision. A chapter has been added on the foundations of buildings. One of the cases referred to in it is a failure which arose from imperfect bedding under a large cast-iron column, bringing injury to the structure. A celebrated engineer was called in, and he discovered that "the top surface of the stone instead of being tooled to a level surface, was hollow towards the centre, and the whole pressure was transmitted to three or four points towards the edges, which sufficiently accounted for the failure." The mason and superintendent probably relied on one of those wise saws so dear to so-called practical men, and the owners had to pay for their temerity. There has been some alarm about the safety of the Nelson column in Trafalgar Square; the load on the clay amounts to no less than 4,665 tons, but that is only equivalent to 1.3 ton per square foot. We are told that "in preparing this foundation an excavation 60 feet square and 12 feet deep was made and filled with concrete to a depth of 6 feet; on this base a frustum of a pyramid 13 feet high was built in brickwork, on which the superstructure was erected." The allusions throughout the pages to executed works are among the features of the treatise, and there is no doubt it will long retain its merited reputation among students of construction.

Another addition to GRIFFIN'S Scientific Text Books is "Sanitary Engineering: a Practical Manual of Town Drainage and Sewage and Refuse Disposal," by J. FRANCIS WOOD, borough surveyor of Fulham. The first part contains chapters on hydraulics, formulae, earth pressure and retaining walls, electric and hydraulic power. The following subjects are then treated

house drainage, land drainage, sewers, separate system, sewage pumping, sewer ventilation, drainage areas, manholes, lamp-holes, &c., trade refuse and river pollution, sewage disposal, bacteriolysis, sludge disposal, construction, material and cleansing of sewers, refuse disposal, chimneys and foundations. As there are 180 woodcuts, it is easy to realise that a wide range of topics is dealt with, and that they are also made as evident as illustrations of apparatus, plans and sections will allow. It would be difficult to find a volume of its size which is so comprehensive. The improvements which have been accomplished are suggested by the modern treatment of refuse. Up to 1894, at Bradford 1,000*l.* a year was expended on the disposal of clinker, while a revenue is now derived from the material amounting to 500*l.* per annum. At Liverpool, Birmingham, Bristol, Bradford and other places flags are made from broken clinker and Portland cement at a cost of about 1*s.* 9*d.*, and they are sold at the rate of 3*s.* 2*d.* a yard. The Corporation of Darwen have up to the present not required any coal in the electric-light station; the heat is generated entirely from the destructors. Concrete bricks and ornamental tiles are also obtained from clinker. In Bradford a new destructor will soon be in use, by which refuse will be destroyed at 5½*d.* a ton instead of 9*d.* As to the purification of sewerage, Mr. WOOD says that at a subsequent time it will be either by electrolysis or chemical agencies; "both seek the same end, but the working of the one is entirely opposite to that of the other; the one aims at the complete destruction of the micro-organisms and the other encourages their growth. Those in favour of electrolysis claim one great advantage—that the spread of disease is an impossibility owing to the removal of the primary cause. If it can be done—and it is possible—the sewage or the sewer air may in the future be treated by this process or some other on similar lines, which would render the air innocuous and inodorous." The chapter on house drainage epitomises the latest conclusions on that important subject.

"Lighting by Acetylene: A Treatise for the Practical Lighting Engineer," by Mr. FREDERICK DYE, M.R.I. London: E. & F. N. SPON, describes one of the most interesting of modern industries. When in 1836 Sir HUMPHRY DAVY's brother discovered acetylene gas and stated it would serve for artificial light, no notice was taken of his words because he was looked upon as no more than a lecturer, and therefore his science was "mere prattle without practice." There was a prejudice against men of this class, and it was left to Germans and Frenchmen years afterwards to draw general attention to DAVY's gas, and an American, T. L. WILLSON, was the first to set up the manufacture of calcium carbide on an adequate scale. The industry has suffered by the apprehensions of its danger, which experience has proved to be unfounded. As a most effective illuminant, which is easily and cheaply produced, proper generators are employed, acetylene gas appears to be admirably adapted for lighting, especially on a restricted scale, and there are conditions under which it can be utilised in preference to other gases. The process is simply and amply described by Mr. DYE. For the lighting of single residences he is of opinion that it can compete with coal-gas and gasoline. If compared with paraffin oil acetylene costs about 20 per cent. more, but it furnishes superior illumination. He says that some people consider that a generator-house should be brick, built with the doors lined with felt and protected with a good-sized box of fresh horse manure, and Mr. DYE thinks the plan sounds feasible. The German insurance companies have formulated a rule that generators and gas-holders must not be placed in sheds or other buildings unless the spaces used are completely isolated from the adjacent spaces by walls of non-inflammable materials without any openings whatsoever." Architects are likely to be often called upon to make arrangements for lighting by means of the gas, and they will find in Mr. DYE's volume information which can be turned to account on such occasions.

Another of the *Builder Student Series* manuals has appeared, entitled "Gas and Gas-fittings: a Handbook of information relating to Coal-gas, Water-gas, Power-gas and Acetylene," by Mr. H. F. HILLS, F.C.S. London: FOURDRINIER. It comprises all varieties of gas illumination, including acetylene. It is mainly adapted for

those who use gas, although the process of manufacture is set forth at sufficient length. Details of burners, shades, globes, reflectors are not ignored. There are also chapters on water-heaters, geysers, boilers, &c. Peebles's Governor is singled out for its effectiveness, for it is said that the saving effected by carefully governing the supply may be considerable. Mr. HILLS's book is a very acceptable addition to the series.

The first of four volumes on "Electrical Installations of Electric Light, Power, Traction and Industrial Electrical Machinery," by RANKIN KENNEDY, C.E., and published by the Caxton Publishing Co., is ready. The work is addressed to practical engineers, and describes what has to be found in workshops rather than in laboratories. All the instructions are given in simple language, and in the first volume, at least, mathematical formulæ are almost entirely eschewed. The illustrations are of a bold character and without any regard for pictorial effects. The majority of the works on the subject recall the lecture-room, but in this publication the construction of appliances is kept steadily in view, and the work when complete will serve the purposes of engineers who utilise electricity for lighting or motor force.

A translation of KEIM's book, "The Prevention of Dampness in Buildings, with Remarks on the Causes, Nature and Effects of Saline Efflorescences and Dry Rot," by Mr. M. J. SALTER, has been brought out by Messrs. SCOTT, GREENWOOD & Co. The author is a patentee of a preparation for walls which are superficially damp, but on which painted decoration is to be executed, as well as the preparations known as "Isolirmastix" and "Troockenputz," which have an allied purpose. This will show that he is no mere speculator or compiler, but has made a serious study of dampness. In most cases he believes that dampness of walls arises from a wet soil. It is also due to salts in building materials, which absorb moisture in the atmosphere, and various other causes. The recommendations of a great many German authorities are introduced. The following is the method of LEO VON KLENZE, the Munich architect, for avoiding ground moisture:—"As soon as the foundation walls have reached a level a few inches below the ground level, the entire area of the walls is to be covered with tar-mortar to a thickness of about half an inch. This tar mortar is prepared by mixing hot tar or pitch with fine quartzose sand to the consistence of ordinary mortar. When the work has been thus tarred, sheets of lead foil are laid on the surface, taking care that where the plates meet they should overlap at least an inch, and that they stand out 1-2 inches from the surface of the wall, so that their ends can be bent downwards. The sheet lead is first painted on both sides with caoutchouc varnish to protect the lead from oxidation. Upon these sheets of lead a course of tiles is laid in the same tar-mortar, and above this the brickwork is carried up with ordinary mortar." A numerous collection of similar suggestions or recipes for remedies will be found in the little book.

From the same publishers we also have a treatise on "The Art of Glass Painting," by Mr. ERNEST R. SUFFLING. The subject is dealt with for the benefit of beginners who wish to have all stages of the process clearly explained. Many students who are able to draw have not had opportunities of observing the course which has to be gone through from the preparation of a design to the final banding. Mr. SUFFLING is a painstaking guide, and we have no doubt that many will be glad to avail themselves of his teaching.

The treatise on "Decorative Brushwork and Elementary Design," by Mr. HENRY CADNESS, of the Municipal School of Art and the Municipal School of Technology, Manchester, published by B. T. BATSFORD, is a genuine students' manual. The author believes that time is money, and his instructions are conveyed in the fewest words. But anyone who will conscientiously study the different chapters will find that he has acquired a larger amount of knowledge than would seem to be possible from so small a volume. Some of the illustrations are reproductions of old and modern drawings, but most of them have been prepared by the author, and are evidence that he is a master of what he is writing about. Decoration in a large sense is aimed at, and it extends from lettering

to architectural forms. The author defines designing as meaning "the planning or creating of something for a definite purpose, in which all the parts employed produce a perfect and useful whole, even apart from any especial consideration of its ornamentation, such as a house, a cabinet, a vase, &c. In another sense, it may mean the devising and disposing of beautiful forms for ornamenting the useful object." The pages show to what extent artists have realised the words, for the book has reference to the past as well as to the present, and to the works of other countries besides those of England.

The late Professor BANISTER FLETCHER was a familiar figure in law courts whenever light and air actions were tried. In his volume on "Light and Air" he gave the benefit of his experience to other practitioners. There never was a time in which there was more discussion of the subject than now, and the Professor's sons have brought out a fourth edition of their father's work, with cases introduced down to 1900. The publisher is Mr. BATSFORD. The editors are not convinced of the advantages of some recent suggestions for the amendment of the law, for they say:—"We are inclined to think that the present methods are the best, with the exception that a professional assessor or assessors might sit with the judge, in a similar manner as is customary in the Admiralty Division."

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifteenth general meeting (business) of the session 1901-2 was held on Monday, June 9, Mr. Wm. Emerson, president, in the chair.

The minutes of the general meeting (ordinary) held on Monday, May 26, were read and confirmed.

The decease was announced of Mr. Coutts Stone, elected Fellow in 1857.

The report of the scrutineers appointed by the annual general meeting to direct the election of the council, standing committees, &c., for the year of office 1902-3 was read, and the following declared elected:—

*President*.—Mr. A. Webb, A.R.A., F.S.A., past vice-president.

*Vice-Presidents*.—Mr. J. Belcher, A.R.A., vice-president; Mr. T. E. Colcutt, vice-president; Mr. A. Darbyshire, F.S.A., president Manchester Society; Mr. J. Slater, B.A.Lond., vice-president.

*Members of Council*.—Mr. F. T. Baggallay, Mr. G. F. Bodley, R.A., F.S.A., Mr. J. J. Burnet, A.R.S.A. (Glasgow), Mr. W. D. Caröe, M.A.Cantab., F.S.A., Mr. W. M. Fawcett, M.A.Cantab., F.S.A., past vice-president (Cambridge), Mr. E. George, past vice-president; Mr. J. S. Gibson, Mr. J. A. Gotch, F.S.A. (Kettering), Mr. G. E. Grayson (Liverpool), Mr. E. A. Gruning, past vice-president; Mr. E. T. Hall, Mr. E. W. Mountford, Professor Beresford Pite, Mr. G. H. F. Prynne, Mr. W. H. Seth-Smith, Mr. R. P. Spiers, F.S.A., Mr. L. Stokes, Mr. P. Waterhouse, M.A.Oxon.

*Honorary Secretary*.—Mr. A. Graham, F.S.A.

*Associate-Members of Council*.—Mr. R. S. Balfour, Mr. H. V. Lanchester, Mr. W. J. N. Millard, Mr. E. W. Wimperis.

*Representatives of Allied Societies*.—Mr. G. C. Ashlin, R.H.A. (Royal Institute of the Architects of Ireland), Mr. H. K. Bromhead (Glasgow Institute of Architects), Mr. F. Caws (Northern Architectural Association), Mr. C. H. Channon (York Architectural Society), Mr. E. W. M. Corbett (Cardiff, S. Wales and Monmouthshire Society), Mr. A. Harrison (Birmingham Architectural Association), Mr. H. G. Luff (Devon and Exeter Architectural Society), Mr. A. Wakerley (Leicester and Leicestershire Society of Architects), Mr. B. Wilson (Leeds and Yorkshire Architectural Society).

*Representative of the Architectural Association (London)*.—Mr. H. T. Hare, Fellow.

*Auditors 1902-3*.—Mr. L. Ambler, Fellow; Mr. H. S. East, Associate.

*Elected as Fellows*.—Mr. H. B. Fletcher, London; Mr. C. W. Methven, Durban, Natal; Mr. F. W. Simon, Edinburgh.

Certain amendments and additions to the Institute paper, "Suggestions for the Conduct of Architectural Competitions," proposed by the Council, were discussed and agreed to as follows:—

The following paragraph to be inserted in Clause 1:—The selection of an assessor should be made with the greatest possible care, as the successful result of the competition will depend very largely upon his experience and ability.

Clause 4 to be amended so as to read as follows:—The number, scale and method of finishing of the required drawings should be distinctly set forth, and they should not be more in number, or to a larger scale than necessary to clearly explain

the design. If the assessor advises that perspective drawing are desirable it should be so stated; and such drawings should be uniform in size, number, mode of colouring or mounting.

The following to be added to Clause 12:—It is important that the award of the assessor should be adhered to unless there is some valid objection to the employment of the author of the selected design to carry out the work, as to which the assessor is satisfied. The setting aside of the assessor's award for any other reason constitutes a breach of faith on the part of the promoters.

### Standing Committees, 1902-3.

*Art Standing Committee*.—*Fellows*.—Mr. J. M. Anderson, F.R.S.E., Mr. J. J. Burnet, A.R.S.A., Mr. W. D. Caröe, M.A.Cantab., F.S.A., Mr. T. E. Colcutt, Mr. J. S. Gibson, Mr. H. Hare, Mr. E. W. Mountford, Mr. A. N. Prentice, Mr. G. H. Prynne, Mr. J. W. Simpson. *Associates*.—Mr. R. S. Balfour, Mr. A. T. Bolton, Mr. S. K. Greenslade, Mr. J. J. Joass, Mr. H. V. Lanchester, Mr. E. W. Wimperis.

*Literature Standing Committee*.—*Fellows*.—Mr. J. Bilson, F.S.A., Mr. A. W. S. Cross, B.A.Cantab., Mr. A. Graham, F.S.A., Mr. B. Ingelow, Mr. W. A. Pite, Mr. G. H. F. Prynne, Mr. R. P. Spiers, F.S.A., Mr. H. H. Statham, Mr. C. I. Townsend, Mr. P. Waterhouse, M.A.Oxon. *Associates*.—Mr. A. S. Flower, M.A.Oxon., F.S.A., Mr. C. H. Reilly, M.A.Cantab., Prof. R. E. Smith, Mr. L. Waterhouse, M.A.Cantab., Mr. A. M. Watson, B.A.Lond., Mr. P. S. Worthington, M.A.Oxon.

*Practice Standing Committee*.—*Fellows*.—Mr. T. Battelbury, Mr. S. F. Clarkson, Mr. F. E. Eales, Mr. E. Flint, Mr. C. Harston, Mr. G. Hubbard, F.S.A., Mr. J. D. Mathews, Mr. W. H. Nash, Mr. J. O. Smith, Mr. E. Woodthorpe, M.A.Oxon. *Associates*.—Mr. W. H. Atkin-Berry, Mr. C. H. Brodie, Mr. M. Clarke, Mr. E. R. Hewitt, Mr. H. H. Langston, Mr. W. L. White.

*Science Standing Committee*.—*Fellows*.—Mr. T. Blashfield, Mr. F. R. Farrow, Mr. J. S. Gibson, Mr. F. Hooper, Mr. W. H. Riley, Mr. H. D. Searles-Wood, Mr. A. S. Snell, Mr. J. Taberner, Mr. E. Woodthorpe, M.A.Oxon., Mr. K. D. Young. *Associates*.—Mr. S. B. Beale, Mr. H. W. Burrows, Mr. M. Clarke, Mr. B. J. Dicksee, Mr. E. R. Hewitt, Mr. G. Pearson.

### THE ROMAN FORUM.

THE scientific exploration of the Forum has been proceeding steadily during the past year under the admirable management of Commendatore Boni, but the results, though both interesting and important, writes a Rome correspondent of the *Manchester Guardian*, cannot be said to possess anything of that startling character by which those of three or four years ago arrested the attention of the educated world. For the present no more light has been thrown upon the Blashfield Stone or the archaic inscription which was found beneath it, and the controversy connected with these objects has gradually died down. The houses which occupy part of the site of the Basilica Aemilia have still to be purchased, and the church of St. Adriano, with its adjacent buildings, has to be expropriated before we are able to tread—as we may hope to do—the floor of the ancient Senate House. Meanwhile much good work of a modest kind has been done. A number of competent workmen are engaged in piecing together, where possible, the architectural fragments which strew the site of the Forum—a process which will bring a sort of order out of chaos, and make the appearance of the buildings to which the fragments belonged more intelligible. More striking is the rehabilitation of the church of St. Maria Antiqua, so far as necessary for the safety of the structure and the preservation of the wall-paintings. The vaulted roofs have been restored, the windows have been filled with glass, the pavement is now being relaid, and we may hope that this unique Roman-Byzantine monument is secured from further deterioration. Another work in progress connected with the general arrangements of the Forum is the preparation of the convent building behind St. Francesca Romana as a museum for the objects discovered in the district. Apart from its contents, this will form a delightful addition to the sights of Rome, with its charming Early Renaissance cloister, from which one passes to the interior of the Temple of Venus and Rome, where the fragments of Hadrian's magnificent porphyry columns are scattered on the ground.

In the new work of actual discovery and excavation the points claim special notice. For some time past on the slope leading up to St. Francesca Romana, the pavement of the Via Sacra of the Augustan age—the very stones one may well suppose which Horace trod in his daily walk—has been uncovered, but now that the excavations have reached the summit of the ridge one can see how the line of the road passed under the platform of the Temple of Venus and Rome and well to the left of the Arch of Titus, the "Arcus in Summa Sacra Via."

Flavian times. Even more interesting in its possibilities is the part of the road leading up to the Palatine, which is now being revealed to the right of the arch with much of its pavement and milestones intact. This, the chief approach to the Palatine in every age, may have much to tell us both of early and of Imperial Rome as its exploration proceeds. Lower down the hill results of great interest are being obtained in the House of the Vestals, where, at the end nearest to the Temple of Vesta, substantial remains of the house of pre-Imperial times are being brought to light. The rooms, with their mosaic pavements, are orientated, like almost every structure older than Augustus in the Forum, obliquely to the lines of the later buildings, and roughly north and south. In fact, it is clear that one of the most important results of the present series of excavations will be the possibility of reconstituting the plan of the Forum generally, with its original orientation, as it existed before the radical change in its architectural setting made by the founder of the empire.

Historically perhaps more important than any of these discoveries was the find early in April, close to the front of the temple of Antoninus, of a prehistoric burial urn. The remains, which were in situ about 12 feet below the surface, consisted of a black jar containing the ashes, and several smaller vessels, the only ornament of which was a kind of raised reticulation, imitating no doubt the cords or wickerwork by which primitive vessels were supported or carried. Pots of exactly similar character have been found in the prehistoric cemeteries on the Alban Hills, but there the receptacle for the ashes generally takes the form known as a "hut urn"—that is, an oval box of black earthenware, with a ridged and overhanging top and a door, the whole imitating as nearly as possible the abode in which the dead person had lived. Now the remarkable thing about the urn found in the Forum is that it is covered by a lid exactly like the roof of a "hut urn," and this suggests that we have before us the last development of the "hut urn," when all that was left of its traditional appearance was the lid or roof. It will be interesting to see whether further search reveals the remains of a regular cemetery; at present only one urn has been discovered, and it is the merest accident that it has not been destroyed by the foundations of the buildings of every age which come within a few feet of it on every side. In any case, here is evidence that the primitive dwellers on, no doubt, the Palatine, allied by race and custom with the Latin inhabitants of the Alban Hills, used to bury their dead in the valley below them at a time when what we know as the Forum was unoccupied ground. It may have been in the ninth, it may have been in the eighth century before Christ, but it is sufficient to mention these facts to show how completely they accord with the traditional accounts of the origin of Rome.

### "HUSTLING" IN AMERICA.

NOT long ago a speaker at one of the English architectural meetings, says Mr. Langton in the *Canadian Architect*, spoke in a congratulatory way of the time being past when a leader of the profession (the allusion was evidently to Sir Gilbert Scott) would go about with a portfolio of churches under his arm to call on building committees. On the other hand, we hear that in the United States nobody dare wait for a job to come to him; that Michel Angelo himself if he lived in Chicago or New York would have to hustle for work. Which of these two tendencies is in the direction of progress? What is all this hustling about? What is there about hustling that should recommend it to clients? The hustler is not hustling for his client's interest, but for his own. A scholarly designer like Sir Gilbert Scott must have been a very high-class hustler. His kind of work implied personal attention to it. Yet there is a story of his going to a church opening, and as he was being driven up to the church turning pale and whispering to his confidential clerk who was with him, "They have got the wrong church."

The typical hustler works *for* work not *at* it, and what the client wants is some one who will work *at* his work.

Of course the hustler works at his client's work in the sense of getting it through. He must have a good staff. That is partly what he is hustling about. It almost seems sometimes as if there is a point of view from which it is the staff which may be said to have a hustler, who spends his time upon the street to find work enough to pay them. Staff work, in fact, is the result of this system.

There is a certain medium class of commercial work for which staff work does well enough, and a certain class of client to whom it is a satisfaction to feel that his work is being handled in what he would call a business-like manner, *i.e.* put through without fuss in the shortest possible time, and looking when done like other new buildings of its kind. As a matter of fact, the work is done in a business-like manner. Let us give the style of practice all the credit that is due to it

in the best examples. The architect runs a plan factory. It has factory merits and factory defects. The merits are certainly a comfort to a client whose interest in his building is commercial, and the defects do not matter much from his point of view. But how about delivering over the whole field of architecture to this system? It is bound to result in staff architecture—that is to say, in factory architecture—and factory architecture is not good enough for good work. Anybody who knows what real planning is like will know that the case of Sir Gilbert Scott will be often repeated in a metaphorical sense. The right problem may be under consideration but the wrong plan will be produced. It is true that H. H. Richardson did not draw himself, but his mind was on design all the time; he was devoted entirely to his work. It is true, on the other hand, that Mr. Ernest George (as he stated when receiving his R.I.B.A. gold medal) does nothing else but draw. He represents, that is to say, the possibility of a first-class man taking care of the design, while some one else gets the work and attends to the business connected with it. But Mr. George is as exceptional in his way as Richardson was. Under ordinary circumstances, if work has to be worked for, the big man of the concern will be devoted to that, as indeed he is now, and the architectural level must fall. That is bad for architecture, but what we are concerned with just now is that it is bad for the owner of architecture—the client. If this estimate of the consequences of hustling is sound, clients have no cause to smile upon the practice.

How about the architects themselves? The profession professedly abhors the practice, and at the end of the tariffs of fees there is a clause defining professional etiquette in a way that practically excludes work-hunting. But there commonly is a jocular way of speaking about the practice that implies uncertainty of purpose. At the bottom of this is uncertainty about the moral basis, a feeling that perhaps the new is the true, and that old-fashioned scruples are perhaps old-fashioned for cause, like horsecars and the old, old systems of fifteen years ago. Morals, however, do not change. A gentleman is the same now as he was in the days of "the grand old gardener and his wife," and as he will be when he walks the golden street of the new Jerusalem. It is this permanent quality of honour that attracts the regard of the architectural profession. The superficial points in professional etiquette may change; ideas of professional dignity may change; ideas of remuneration may change; the basis of these is not too deep for joking, but the matter of getting work is.

The truth seems to be that there is only one way of getting work that is right, and that is that an architect should always do his best work, put his best goods upon the market, that is to say, and let them speak for him.

It is a hard condition, for growth from small to large work may be slow. People who employ an architect for important work like to see something that he has done of the same kind. "We judge ourselves by what we think we can do, but others judge us by what we have done," is a maxim which exactly fits the case of the young architect and states his difficulty. Competition (a question by itself) is accepted as a means of making a rapid step between small work and large. But competitions or not, the step is sure to come in time to the really able, and usually before long, so that though, like all other right conduct, some patience and faith and self-government are implied, the condition, though severe, is not more than a man should accept.

Why is this the condition of honourable practice? Because the moment a man reaches out for work he is reaching out for somebody else's work. If the work would not naturally come to him, it would naturally go to someone else. He reaches out for it, uses a "pull," asks, persuades, or merely works the magnetism of his personal presence—highly magnetised for the occasion—and the deed is done; he has knifed a neighbour.

This is the bottom fact that makes the profession uneasy about going about to get work. It is the disregard of others that is the dividing line between honourable and dishonourable practice. When another architect is already engaged, it is easy to recognise that he has rights, and the better members of the profession are strict about not interfering there. It is a more uncertain state of affairs when work is in the air, and seems to be only waiting to be grasped. It is agony not to grasp it, but there is always a sense of shame before other members of the profession in doing so—and is not this the cause, that it has to be taken from some other member of the profession? If it is ours we may wait for it; if it is not ours, whose is it? Somebody else's. Then for "taken from some other member of the profession," we may read "stolen from some other member of the profession." It seems strange that men should think their duty to their wife and family obliges them to steal from some other man's wife and family. And this in a Christian land. Surely before we adopt the (reputed) American practice we should pause to think where we are going.

## NOTES AND COMMENTS.

Two important cases relating to scaffolding have been decided by the Court of Appeal. In *MARSHALL v. RUDEFORTH* the decision in *WOOD v. WALSH* and *HODDINOTT v. NEWTON, CHAMBERS & Co., LTD.*, that a scaffold cannot be a single article such as a ladder was confirmed. Workmen were engaged in repairing a roof, and the plaintiff was carrying slates for their use. While on the ladder it slipped, and he was injured by his fall. The judge of the Scarborough County Court held that a ladder was not a scaffolding within the Act. The plaintiff appealed, and counsel contended that a ladder was not a single structure, but was constructed of two uprights and crosspieces, and it made no difference whether a builder carried such a combination with him or formed a scaffolding as occasion required. The Master of the Rolls said he was unable to define scaffolding in terms which would exclude a ladder, but that did not mean that scaffolding in law included a ladder. The County Court judge affirmed a ladder was not a scaffolding, and it was to be supposed he was correct. Lord Justice MATHEW and Lord Justice COZENS-HARDY agreed that a ladder could not be treated as scaffolding. The appeal was therefore dismissed. The second case was an appeal by the representative of a workman who was killed while fixing ornamental work to a verandah. He had to climb a ladder across the top of which a piece of board was nailed. There was also a piece of timber stretched across three stays of the verandah from which the men worked, and the question was whether or not scaffolding was being used at the time of the accident. The County Court judge held that scaffolding was being used. The defendant appealed, and it was contended that the judge found that the ladder alone constituted scaffolding, a decision which it was argued could not be supported. The Master of the Rolls said the appeal was brought under a misconception. There was no doubt from the evidence that the judge in holding that scaffolding was being used had in his mind the piece of timber stretched across the supports of the verandah. The appeal was therefore dismissed. It will be observed that the distinction between the two cases is very slight; in both a ladder was used, but in the latter case it was placed against wooden stays, whilst in the former it rested against the parapet of the house. The divergence was, however, sufficient to produce entirely different decisions, although in a builder's eyes the circumstances were identical.

VARIOUS claims are made in local districts about the possession of the earliest memorial brass in England. But when the Sussex Archæological Society visited Trotton, or Tratton, on Tuesday, Mr. P. M. JOHNSTON, architect, said that the brass of Lady MARGARET CHAMOYS was the first known instance of a lady's effigy in England. The present building dates from about 1250, and it is presumed Lady MARGARET was connected with the work. There is another fine brass on an altar tomb in the church which is a memorial of Baron CHAMOYS, who fought at Agincourt, and of his wife, who was the widow of HARRY HOTSPUR. The church is dedicated to St. GEORGE, who was a favourite patron in Sussex, and a Saxon church stood on the site of which the font is a survival. The church has another interesting association, for THOMAS OTWAY, the dramatist, was born in Trotton in 1651, and was the son of the rector of the parish. His "Venice Preserved" was long a favourite tragedy.

OFFICIAL as well as non-official judges would approve of the erection of workmen's cottages by ordinary employers. In country districts especially labourers experience a difficulty in finding accommodation for themselves; but whatever may be the rule in the case of an individual, it does not apply to municipal owners. The Cuckfield Rural Council wished to build cottages for their workmen in Lindfield, but the Local Government Board declined to give the necessary sanction to the project. The following was the circumlocutory answer received in reply to an application:—"The Board are advised that the District Council have no general power of providing dwelling accommodation for their workmen, and this being the case the Board would not be prepared to consider the application for sanction of a loan for the provision of houses for

workmen employed on roads. As regards the proposal to provide dwellings near the sewage farm for workmen employed there, it would not accord with the Board's practice to entertain the application for sanction to borrow under the Public Health Act, 1875, for such a purpose unless the District Council could show that the provision of the dwellings is reasonably necessary for the management of the farm." When we recall the large scale on which municipal trading is conducted throughout the country it seems incredible that so important an experiment is prohibited. If possible the subject is to be brought under the notice of the House of Commons, but at the present time it is not likely to receive much attention.

THE occupation of the Pavillon de Flore by the French Minister of the Colonies has excited alarm, for if a fire broke out amidst the official documents some of the treasures of the Louvre might be jeopardised. The obstacles in the way of finding a site have, however, delayed the removal. There is at length a possibility that the danger will be overcome. M. DEGLANE, the designer of the Grand Palais of the Exhibition of 1900, has received instructions to prepare plans for new offices. The site selected will be somewhat remote, being in the Avenue Rapp, which is close to the Eiffel Tower, but it would be hard, unless by a large outlay, to obtain a more suitable position. The French Government Offices are farther apart than those in London.

## ILLUSTRATIONS.

GRINDLAY &amp; CO'S BANK, PARLIAMENT STREET, S.W.

VIEWS IN THREE GERMAN CITIES.

WHEN an English architect has a fortnight, or less, for a holiday, it seems hardly wise for him to choose the Rhine for the scene of his recreations. Yet a tour in this direction can be done, and with profit. It is not unmixed pleasure, however, for many pangs must be endured in necessarily skipping some of the most alluring spots.

To begin with—Köln would perforce be reached with barely a halt by the way. Here, after the cathedral and other fine buildings had been duly admired, the sketching tourist would probably find himself more or less busy among the streets of ancient houses in the neighbourhood of the river (see Illustration). These old streets are rapidly disappearing in the face of modern improvements.

Travelling being resumed, the difficulty of finding time to visit the fascinating towns and villages on the Rhine banks, with their black and white buildings facing the river is positively galling. One must needs steam on to Coblenz. This reached, much of interest reveals itself in the way of quaint German architecture, the buildings bordering the river being in some respects the most attractive.

A brief stay at Coblenz, then more steaming up the Rhine, more pleasure as wonderful landscape, threatening castle, nestling town or village come into view, more pang as each bit of loveliness is, after one glimpse, left behind.

However, Mainz is a stopping-place, and this is well. There is very much in this city to make one stay. After many spots of interest have been located and rushed, it is probable that the cathedral and its surroundings will have the effect of temporarily rooting the sketcher (see Illustration). There is no time for more, and the touring architect re-tours to his native country, wiser, happier and cooling by degrees.

HOUSE AT KOKINE, RANGOON.

THE favourite residential suburb of Rangoon, Burma is Kokine. The residence of Captain A. J. WINDYBANK is built on rising ground, and overlooks the famous Shun Yagou Pagoda. It is built of teak wood throughout and rests on concrete in patent iron shoes. All window fittings are made of brass. Verandah runs all round the house. The architect and builder is Mr. J. ROBINSON Camp Road, Rangoon.

UPTON COTTAGE, SLOUGH: SOUTH-WEST AND NORTH-EAST VIEW

CATHEDRAL SERIES.—RIPON: THE WEST FRONT. THE WEST ENTRANCE.

THE ENGINEER OF THE TWENTIETH CENTURY.\*

Our last annual convention my predecessor addressed you upon engineering in the nineteenth century, and at meeting our secretary has given you a sketch of the history of our own Society during its first fifty years, which have closed before our next annual reunion. It seemed to me, therefore, not inappropriate that to-day I should take a glance towards the future and say something concerning the outlook for engineering and for our Society in the new century upon which we have just entered. It is true that in doing this we must to some extent leave the solid ground of accomplished fact, which is the special province of the engineer, and enter upon the insecure and dimly lighted field of possibility and prediction in which the most wary may easily be led astray. On the other hand, it is entirely safe and legitimate to predict the fruit from the seed, and all wise action in the present must be based upon correct views of the results which they will produce. In every field of

\* The presidential address of Mr. Robert Moore before the American Society of Civil Engineers' Convention at Washington, and printed from the *Engineering Record*.

activity the successful doer is the clear and successful seer. What, in fact, is the whole life of the engineer but an effort to conceive plans and execute works by which the future shall be made to surpass the present? So that as engineers we may claim the future as part of our field no less than the present or the past.

What kind of a man, then, will the engineer of the new century be, and what the scope of his work as compared with the engineer and his work in the century which has just closed?

Before proceeding to consider this question, let me say that in speaking of the engineer I shall use the word in the comprehensive sense of Thomas Tredgold's well-known phrase, as one who directs "the great sources of power in nature for the use and convenience of man," a sense which includes every subdivision of this work. Carlyle has rightly said that man is pre-eminently a tool-using animal, one who converts the materials and forces of the external world into instruments of service, thus making nature his slave instead of his master. The engineer is one who devotes his life to the designing and making of tools.

With this understanding of the word, what shall we say of the engineer of the new century as compared with the engineer of the century which has just closed? In answer we may with perfect assurance say that he will be a man of more comprehensive and thorough training, a better equipped and therefore more serviceable man than his predecessor of the last century.

Until very recent years the engineer as a man of learning, even in his own profession, has not been the peer of the clergyman, the teacher, the lawyer or the physician. In fact, speaking broadly, engineering has not been one of the learned professions. And for this the reasons are not far to seek. As a distinct profession that of the engineer is much younger than those just mentioned, and, what is even more to the point, the sciences which set forth the laws that govern the materials and forces of nature and underlie engineering works are all of recent development.

Historically, as we all know, the oldest profession is that of the priesthood. How to ward off evil spirits and propitiate the invisible powers has been one of the earliest studies of every people, and they who knew, or were believed to know best, how these ends might be accomplished, were differentiated into a separate class who became the custodians of all the learning then attained by men. The priests were the scholars, the learned men of their time. As such, they were the medicine-men, or physicians, the healing art being at first almost wholly a matter of incantation. As conservators of tradition they became the arbiters in disputed matters, and thus the lawyers and judges. As the only learned men they were, of course, the first teachers or instructors in letters. In important structural works, the first of which were largely temples, they were the natural leaders and as such the first architects. And their early activity in the field of engineering may be seen in the fact that amongst the Romans, the most practical of nations, the high priests were styled pontiffs or bridge-makers, and the high priest was pontifex maximus or the chief bridge-builder. The oldest engineering society was, no doubt, that of the Fratres Pontifici, or the bridge-building brotherhood of Benedictine monks, who, during the Middle Ages, chose as their special work the building and repair of bridges. How well much of this early work was done, many an old cathedral and many an ancient bridge bear abundant witness.

In process of time, however, each of these subordinate fields of knowledge and practice became so extensive and so exacting of time as to be beyond the compass of any one man or class of men, and each gradually became the special field of a distinct profession. In the order of time the physician, the lawyer and the teacher, the professor *par excellence*, came first. Then followed the architect as the skilled designer of houses, and last of all, the engineer or the millwright and the skilled maker of roads and bridges.

But the structures which the first engineers were called upon to build, whilst they demanded skill and courage and judgment, called for little of the learning found in books. Some practical skill in arithmetic and geometry, and possibly trigonometry, was the limit of the scientific knowledge required. Engineering was an art and not a science, and the engineer was but little more than a highly skilled workman. And, as in all the arts, the standard method of instruction was that of apprenticeship in which by word and by example the master slowly transmitted to his pupil the art and mystery of his craft. James Brindley, builder of the first important English canal, was a cotter's son and served seven years as a wheelwright's apprentice. George Stephenson, builder of the first successful locomotive and railway, was eighteen years of age before he learned to read. Thomas Telford, builder of roads and bridges, and first president of the Institution of Civil Engineers, was the orphaned son of a shepherd and served a seven years' apprenticeship as a stonemason. Smeaton and Watt were

mathematical instrument makers, and both men of considerable training, but as engineers were almost wholly self-taught.

In like manner in our own country the engineers, who, in the first half of the nineteenth century built our first canals and railroads, such men as James Geddes, Benjamin Wright, Canvass White, Loammi Baldwin, Nathan Roberts and Jonathan Knight, were all men with no learning beyond that of the elementary schools and whose professional training was gained in the school of experience. Though men of judgment, skill and courage, men of force and of brains, they were not men of science.

Beyond mathematics, the higher developments of which were known only to a very few, the sciences which underlie the engineer's work had not yet taken form. Structural mechanics, thermodynamics, chemistry and electricity as organised sciences did not yet exist. But since Carnot, Davy, Faraday, Joule, Rankine, Maxwell, Clausius and others like them have done their work, all this is changed, and he who would now enter the field as an engineer with the slightest hope of success must have mastered the sciences which the labours of these men have developed. The knowledge which had to suffice for his predecessors is no longer enough.

Out of this new need, and as the shortest road to such mastery, has grown the engineering school in which these new sciences are specially taught, a growth which has been characteristic of the last half century, and which during the last few years has been phenomenal. As introductory to the engineering school, and as the foundation upon which its work must be laid, there is, of course, needed a thorough grounding in the general principles of the sciences of matter and motion: to wit, elementary mechanics, physics and, above all, mathematics or the science of number and measurement. But, in addition to this training in the elements of the mathematical and physical sciences, there is also needed for the proper equipment of the engineer a broad elementary training in the other departments of human knowledge which are by contrast metaphysical and as yet unmathematical.

We cannot know anything correctly except as we know its limits and its place in the general system of things. Even the place where we stand on the earth cannot be accurately located except by its co-ordinates of latitude and longitude which define its position with reference to the whole globe. Every well-trained professional man, therefore, must have, as part of his equipment, the broad outlines of general knowledge. He must know something of language and literature, of political science and of history, something of what the world's workers have done and of what its thinkers have taught, in order that he may correctly understand and evaluate the knowledge peculiar to his own calling. To know everything about something, which is his business as a professional man, he must also know something about everything.

A broad basis of general knowledge such as shall put the man in touch with all times and with all men must, therefore, precede the special knowledge of the technical school. Otherwise there may be much mastery of detail, a microscopic thoroughness, but not the firm grasp and clear insight which he broader training gives. In fact, if a choice must be made, is better to shorten, or even to omit the training of the technical school, leaving the man to supply this deficiency for himself, rather than to sacrifice the broader outlook and the wider sympathy which is given by the more diversified training in the outlines of general knowledge.

It is safe to say therefore that in the new century he who aims at the highest success as an engineer must be a more learned man than his predecessor of the last century. He must be master of the strictly engineering sciences, and as a basis and introduction to these, he must have the wider training of the preparatory school and the college.

All this, however, is but the beginning. For, in addition to the training which is to be gained in schools and from books, he must have the training which is to be gained only in the post-graduate school of actual life and work, in which alone the final degree of engineer in fact can ever be attained.

For it must never be forgotten that for real success in any calling, be it that of the professional man or the man in political or commercial life, there is needed something which neither books nor schools alone can teach, something which is partly the result of inherited qualities and partly the result of our daily contact with men and things, something which is the resultant of the reaction of our inheritance upon our environment, and which we sum up in the word character. Before there can be real power in any walk in life there must, in addition to technical training, be energy, veracity, self-respect, courage and address. That is to say, before we can have the able engineer or the worthy exemplar of any profession we must, first of all, and more than all, have a strong and worthy man.

And for the development of these manly qualities what better school can there be than is found in the daily life of the working engineer? For, first of all, in so far as he is an engineer he must be an open-minded and essentially truth-

loving man. As the prime condition of his control over forces of nature he must see things and their relative value not as he wishes them nor as he already thinks them to be, but exactly as they are in fact. With the facts before him he must have the skill to rightly interpret them, and to this he must have the courage to make his actions conform to his conviction. He must be a man of invention and resource, one who can promptly as well as see clearly.

At his own peril he must not deceive himself. Otherwise his works will fail and he fail with them. And with equal emphasis is he warned against all attempts to deceive others for in no calling are such attempts so quickly detected and certainly futile. A false theory in medicine, in law, or in theology may live, as many have lived, undetected for thousand years, but a false theory in engineering is disproved by the first attempt to put it in practice. If its embodiment be an engine it refuses to go; if it be a structure it falls in pieces. The pretender, the quack and the charlatan have no abiding-place amongst engineers. They are so quickly unmasked that they speedily disappear. No one, in fact, is sure to be known at his true value as is the engineer, and one can so well afford to discard all artificial aids to recognition. What he does is in the sight of all men, and speaks for him.

Work of his hand  
He nor commends nor grieves;  
Pleads for itself the fact,  
As unrepenting nature leaves  
Her every act.

And if it be a question of motive, to whom is the duty and dignity of a life of service brought more closely home than him whose lifework is found in directing the sources of power in nature for the use and convenience of man? And what greater pleasure and satisfaction can there be than a life devoted to solving the riddles which nature everywhere propounds, knowing as we do that every new solution means a fresh source of power and benefit to mankind? In fact, the whole tendency of the engineer's life and work is to clarify and quicken his intellect, to train his will, and to strengthen every good impulse. How many shining examples and proofs of this are found in the roll of members, living as well as dead, of our own Society; how many have we ourselves known, strong, alert, kindly, clear-headed men, men quick to respond to every call of duty and who could be trusted to the uttermost in every relation of life?

If to a character such as this we add a grasp of the broad outlines of general knowledge and a command of the new sciences which the labours of the last two generations have bequeathed to us, we have the man who will be the typical engineer of the new century. He will be not unlike the engineer of the last century, but will, in fact, be his true successor and considering his greater opportunities, be no more to be commended. Yet as a man of wider knowledge and ample intellectual resources he cannot help being a man of greater power. Great as have been the men and great as has been the work of the engineers of the last hundred and fifty years during which the steam-engine, the railroad, the telegraph, the telephone, the power press and the myriad other improvements have revolutionised the conditions of human life, making it not only longer but richer and better worth the living, there is reason to believe that even greater work is in store for our successors. Certain it is that as knowledge grows the field of its application to the uses of daily life must also grow. Even now almost every process of manufacture and transportation as well as all the machinery of war, both on land and on sea, are the work of the engineer. And in the future, even more than in the present, will the secrets of power be in his keeping and more and more will he be a leader and a benefactor to men. That his place in the esteem of his fellows and of the world will keep pace with his growing capacity and widening achievement is as certain as that effect will follow cause.

In this higher development of the engineer and his work this Society, as the leading organisation of its kind in the country where engineers have accomplished most, is certain to bear an important part. This it will do in part by the intellectual stimulus of its papers and discussions. Even our Transactions are an essential part of the library of every working engineer and of every engineering school.

But more important than the intellectual stimulus of our Transactions will be the moral stimulus of the personal contact and acquaintance made possible by our meetings. It is, in fact, hard to over-estimate the value of such meetings in quickening the interest and raising the standards of those who take part in them. Nothing is so vitalising as the meeting of those of like sympathies and common pursuits. Scattered, the members may die out; in contact they burst into flame.

But animated by the inspiration of example, personal contact and friendship, hardly any limit can be placed upon the effect of an organisation such as ours in lifting our profession to the highest plane of real service and honour well deserved.

## THE WASHINGTON NATIONAL MONUMENT.

**DESCRIPTION** of the immense memorial of George Washington in the capital of the United States was read by Mr. Bernard R. Green at the Convention of the American Society of Civil Engineers. It is purely a masonry structure on the bed of the foundation to the peak of the pyramidion. The interior iron columns, stairway, landings and the observation deck at the top of the shaft proper form no essential part of the monument itself. Designed as an Egyptian obelisk, the effect was a monolithic effect, and this is practically obtained at a moderate distance, where the fine joints and slightly varying shades of the individual stones are not apparent. At 150 feet above the base, however, there is a distinct change of appearance, especially in wet weather, between the old and new portions of the work.

The dimensions of the monument are:—Total height, 55 feet 5½ inches; shaft proper, 500 feet 5½ inches; base, 34 feet 1½ inches; top, 34 feet 5½ inches; pyramidion, 55 feet 5½ inches; interior well, 25 feet square up to 150 feet, splaying out to 31 feet 5½ inches at 160 feet, and thus continuing to top of shaft; batter of exterior, ¼ inch to 1 foot; thickness of walls at base, 15 feet, at top 1 foot 6 inches; foundation, 126 feet 6 inches square and 36 feet 10 inches deep.

As the original foundation was built 15 feet 8 inches above the then natural surface and subsequently buried by artificially raising the mound about the monument, the total height of the structure actually built is 571 feet 1½ inches, but the present visible obelisk alone is still the highest masonry structure built by man by some 20 feet.

It was built in two parts. The first by the Washington National Monument Society, a private organisation, which raised some 300,000 dols. by popular subscription. Excavation for the foundation, 80 feet square and only 7 feet 8 inches deep in an ordinary sandy clay alluvium, was begun in 1848, and the corner-stone laid on the bed on July 4 of that year. A solid rubble masonry footing, 80 feet square, stepped up to a height of 23 feet 4 inches and a width of 58 feet 6 inches square at the top, was built of blue gneiss rock from the Potomac shores near the city, in derrick sizes and smaller, in lime mortar. Barring the mortar, which naturally never hardened beyond the reach of atmospheric influence, the rubblework was good. On the top of this footing the monument shaft was started with a white marble facing in 2-foot courses, with beds of 15 to 18 inches and a few headers, backed up with rubble masonry like that in the footing. In 1854 this had reached a height of 154 feet and 6 feet in 1856, when, owing to lack of funds and other unfavourable conditions, the work came to an end and so remained, actually abandoned, until the Government assumed it by an act of Congress on August 2, 1876, the Centennial year.

The work had been prosecuted on a plan of obelisk which would be 600 feet high, involving a total weight of some 1,000 tons that would impose a load of 10·6 tons per square foot on the ordinary kind of soil described. At this time the shaft had reached about 35,000 tons, and the load was ready 5½ tons per foot. Whatever original bench-mark may have existed was lost, and the amount of settlement that must have occurred was unknown. Doubts of stability naturally arose as time went on, and the law therefore conditioned the continuation of the shaft upon proper assurance of the efficiency of the foundation. A board of engineers then made thorough investigation and reported that the soil was already added to the limit of prudence, if not of safety.

Then, on June 25, 1878, the work was placed in charge of Lieutenant-Colonel (later Brigadier-General) Thomas Lincoln Casey, of the corps of Engineers, who was required to prepare a plan for properly strengthening the foundation. This was done within a month and the work accomplished during 1879-80 as follows:—

A much firmer stratum of gravel, sand and small boulders existed at 13 feet 6 inches below the old foundation, which was underpinned with Portland cement concrete blocks 4 feet 6 inches high, 13 feet 6 inches deep, 41 feet 3 inches long, 18 feet of which extended underneath. These were put in singly or in pairs, one on each opposite side, as the tendency of the monument to lean towards the respective cuts appeared, and this was constant until a number of the blocks had been inserted. Frequent level observations were kept up on brass pins at the four corners of the shaft, which showed an extreme sensitiveness to the least disturbance of the earth underneath the old foundation. Finally, the underpinning was completed, leaving, as will be noted, a block of untouched earth 44 feet square in the centre. Jack-screws were used solely to retain the side-pressures of the earth in the trenches, and the concrete was forced up under the old footing masonry with a swinging horizontal battering-ram timber. Then the old rubblework was quarried out around the sides in sections about 10 feet wide, and concrete buttresses were inserted about 3 feet under the edge of the shaft, and extending well out to the projecting underpinning. When all were in they formed a continuous buttress all round. In this way 70 per cent. of the original earth-bed was cut away and replaced by

the concrete underpinning, 51 per cent. of the rubble footing was torn out, and 48 per cent. of the bed area of the shaft itself undermined and filled with concrete.

During this operation the total settlement of the structure was 2½ inches, the greatest difference between any two corners being ½ inch, which nearly corrected an original inclination of about 1½ inches in the old shaft at 156 feet height.

This accomplished, the continuation of the shaft was resumed on August 7, 1880, and the capstone set on December 6, 1884. The facing is white marble in 2-foot courses of 2-foot bed in alternate headers and stretchers, backed up with cut granite, all laid in Portland cement mortar.

The top of the shaft being but 18 inches thick and 34 feet 5½ inches square, a unique design for a marble pyramidion was necessary, and was executed as follows:—

Thirty feet below the top of shaft three steep arch ribs 12 inches thick start out on each of the four inside walls and extend up, so that at the top the middle one projects 7 feet and the others 5 feet inward. Above this level the ribs continue with 12-foot slabs on edge about 4 feet 6 inches high, the middle ones meeting at a common keystone and the others in pairs on the hip corners of the pyramidion. The latter consists of 7-inch slabs 4 feet 6 inches high and 7 feet or less in length, jointed like slightly overlapping tiles, independently carried by peculiar hook joints on the respective slab voussoirs of the arches, on which they rest crosswise. Above the keystone these covering slabs box around and rest on each other, terminating in a single pyramidal capstone about 5 feet in height.

The total weight of the monument, including the foundation and interior ironwork, is 90,854 tons, loading the foundation not over 10 tons per foot in the centre, nor less than 3½ tons at the outer edges of the foundation. The construction of the shaft produced a further settlement of the foundation, making a total of about 4½ inches, but no material change has occurred since. Wind has no appreciable influence on the monument.

## ILLUSTRATED BOOKS.\*

**T**HE treatment accorded to the making-ready or preparation for the printing of woodcut blocks and of those made by process is quite different, especially for those by the half-tone method. Formerly the degrees of light and shade were obtained from the woodcut by lowering the block in certain places where light effects were desired, and the solids were left standing in the original height. We have the precedent of Papillon, the French authority of the eighteenth century, for this. With the introduction of engraved wood blocks, another method had to be employed in order to secure the different degrees of tone, and these gradations were brought out by overlaying with various layers of very thin paper cut to the required size and shape. This was first assisted, where necessary, by underlaying the block itself. This having been done, the overlays are made from, say, three pulls taken on a fairly hard paper; the light or high tints being cut out in the first case, and in the second and third pulls the medium tones and solids would be also cut out, and such pieces then affixed respectively to the first one. By these means the full results of light and shade are obtained when this overlay is put into the exact position. It is, of course, necessary that the workman should have some artistic appreciation before a good result is obtained.

With half-tone illustrations quite another method must be employed. It is absolutely necessary that the block be very truly underlaid, in order to bring it up to the exact type level—some prefer a trifle higher—and also that it be equally level at the four corners, without any rocking on its base of wood or metal. This having been done satisfactorily, little or no overlay is required for the proper printing of these illustrations. Given the proper ink and paper, with a hard and sharp impression, this is all that is necessary. Any drag or slur on the impact of the printing surface with the impression cylinder of the machine is most detrimental to the finished print.

I have referred to the beauty and depth of "colour" of the black ink used by some of the old masters. The printer formerly made his own ink, and he was a wise man in his own generation. Nowadays the modern printer buys all his ink, and as a rule the secret of what was called "the art and mystery" of printing lies very largely in the ink. In these days of chemicals one hardly knows how inks are made, because they have to be adapted to the modern requirements of shining paper and process blocks, and what are considered full or good effects are only arrived at by the use of some stimulant, usually a chemical or mineral, and then one never knows the ultimate result. I have seen, by the use of improper inks, some very alarming results.

\* From a paper by Mr. C. T. Jacobi, read before the applied art section of the Society of Arts.

For good paper, whether handmade or otherwise, it is essential that a fine carbon ink be used. Any so-called bloom or sheen is usually obtained by the use of a metallic or other substance which is sure sooner or later to develop some chemical action. For plain type printing a perfectly pure pigment must be used, but, unfortunately, for the satisfactory working of half-tone blocks the ink has to be very considerably doctored for fast-running machines. A comparison of the bulk of impressions with the engraver's proof is not always a fair one, because an ink giving good results for single proofs would be quite unworkable on a machine that may only be running at an average rate.

A good deal has been written and said about the "sixties" in the annals of illustration. In some respects I think the glamour connected with this period is not always deserved. True there were many capable artists and many came to the front. Much of the work was well designed, but it was not always well engraved—at least, that is my opinion—and some of it would have been better if it could have been processed, which of course was not possible at that date. Having ventured this opinion, I will go further and say that very many of the books of that period were anything but the "fine art books" they profess to be. I say this to the detriment of my own craft, for I cannot help thinking that with proper consideration the general get-up of many of these volumes could have been better designed, and what is more, better printed.

In surveying the English illustrated book of the first half of the nineteenth century—that is, from the time of Bewick up to the sixties—I find that a great many books of representative character emanated from the Chiswick Press. These books are both of pictorial and decorative character, and many were done in conjunction with William Pickering, the publisher, who died in 1854. The shape and form of these books was only arrived at after a great deal of deliberation and experiments. This the late Henry Stevens tells us in his little brochure, which I would advise all to read, for it will be to their advantage. In this little work he respectively applied the lash to the author, publisher, printer and binder, and much of his trenchant criticism was deserved.

To render full justice to the new school of engraving it was necessary to employ special methods in printing, and it is a tradition of the Chiswick Press that overlays, the use of which has already been explained, were first used in that establishment, though I have read of a French claim to that innovation. At any rate, Mr. Whittingham was one of the first to practise overlaying and to bring it to perfection, so much so, that it is said that Bewick was fairly delighted with his treatment of wood engravings in printing. Mr. Whittingham's tombstone in Chiswick Church records that he "attained considerable eminence in his art, particularly in the printing of wood engraving."

We must all regret the decline of wood engraving, for, in connection with type printing, it was the true method of illustration. It was capable of giving much decorative expression that can scarcely be hoped for in any mechanical process. It is, however, some consolation to know that methods of reproduction have improved so much that it is possible, with a due regard to the altered circumstances, to obtain good substitutes for hand-engraved work. In some cases facsimile line-work may be even better rendered by process. If we wish to see how far process has succeeded, we have only to refer to the reproductions of the work of two such very different artists as Mr. Hugh Thomson and the late Aubrey Beardsley. Here are the two extremes of method in drawing.

In dealing with process work I propose only to consider such blocks as can be printed with type, and not the other methods which require quite a distinct and separate treatment in printing—such processes falling under the heads of photography, lithography, or those using gelatinous films.

The closing years of the nineteenth century saw the rise of process work, which created the almost universal demand for illustrated literature that could be both expeditiously and cheaply produced by the various methods in vogue. Photography does not lie, though it may distort, therefore I consider that there is no degradation in the reproduction by mechanical means of drawings in line.

When we consider this advantage, and the fact that any block for printing purposes can be produced quickly and at a nominal expense, it is easy to account for the great demand for blocks mechanically produced.

In former times the artist was somewhat at the mercy of the engraver, for whether the original picture was drawn on the wood direct or photographed thereon, as was the custom in the latter part of the century just closed, everything depended on the engraver—for it was he who gave the expression or interpretation to the artist's work.

It is true that artists were sometimes engravers too, but such cases were rare. Naturally, some of the very best examples of wood engraving extant are those which were both drawn and engraved by the same individual.

With regard to the blocks executed by the half-tone method,

which reproduce surfaces rather than thin lines, either direct from nature—that is, from a photograph taken direct from object—or from drawings made in wash, there is room for difference of opinion. Without doubt there is not the artistic merit in these productions that may be found in the original process, but I think we shall all agree that this method has greatly improved during the past few years, and that the high-water mark of excellence has been very nearly reached. The results, so far, are mechanically very ingenious and marvellous, even if we do not think the general effect artistic.

Such blocks are very much improved if afterwards engraved on by hand, as in the case of many of the illustrations appearing in some of the American magazines, but this requires much practice and considerable feeling if it is attempted, otherwise the labour is in vain. Vignetting of half-tone work is something that our cousins seem to have brought to greater perfection than we have.

It is necessary, in considering picture-books, to discriminate between those illustrated from a pictorial or graphic point of view, and those of a purely decorative character. Sometimes we have books where a combination of the two motives is attempted, but often without much success. Some works, owing to the nature of the subject, require illustration, but pure decoration is aimed at, it should be either thoroughly worked done or left alone. In a plainly printed letterpress book there is scope for intelligent work, and it does not always require embellishment to make it what might be considered an artistic production.

Much of the work offered as decorative is overdone, and is always in accord with the typographical setting of the page. Ornament should be sparingly used and subordinated to the text, and not made to swamp the letterpress. In decorative designs occasionally forget that the object is to fill a blank space, not to create one; and, on the other hand, pictorial graphic art is usually secondary to letterpress, because it serves to elucidate or illustrate the text. Some will go out of the way to improvise an opening for their extravagant fancies. If one of two facing pages is short, it obviously requires something to preserve the balance, and here is the opportunity for the artist.

Absolute harmony does not exist between type and illustration, but it is quite possible to reconcile the two with some degree of success, provided due care be exercised.

Truly decorated books are those executed throughout by the same hand, such as William Blake's, the illustration and lettering being woven as it were into one design, but commercial considerations will not allow of this, therefore the artist and printer must help each other. Type letters, as a rule, are conventional in form, so the selection of a proper fount, and one of a suitable size, requires some amount of judgment.

Again, many of the typographical flower ornaments employed by the seventeenth and eighteenth-century printers were in keeping with prevailing types of those periods, if consistently used. Gothic ornament should go with black-letter type, and designs of a linear character with Roman type. I propose to show you on the screen some slides which will demonstrate these simple facts.

It would be out of place for a printer to criticise artistic work, but I venture to say that the draughtsman may often do much to produce a good effect by adapting his line, as far as possible, to the strength of the letterpress.

In printing any work with mechanical reproductions, we are limited to two kinds of blocks in relief, viz. line and half-tone. These can both be used as textual cuts or as full-page illustrations, either separately or backed with type. Separate plates are not, however, limited to these two kinds, but photography, lithography, or the various gelatine processes, such as collotype, may be employed. It is this mixture of the processes that I object to, and it should be generally deprecated.

The adoption of many processes in any one volume sometimes made worse by the use of a different paper for each kind of picture, with the result that the volume appears to be a mere sample book of papers and processes.

One other thing to be avoided, if possible, is the interspersing of plates on smooth paper with text on a rough paper. This may sometimes be prevented by relegating the plates to the end of the volume, thus dividing into two sections of (a) letterpress, and (b) illustrations.

Referring to those smaller blocks which fall in the letterpress page, designated as textual cuts to distinguish them from those occupying full pages, from a decorative point of view rectangular blocks are better than those of an irregular vignetted shape. It is not satisfactory to see half-tone blocks made so that they run into the text in any shape, stepped in and out in fantastic forms, with the letterpress straggling all over the page, so that it is confusing to read. The illustrations should be kept within bounds if possible; that is, within the limits of the type area. For the sake of symmetry full-page blocks should be of the same size as the letterpress page. If a medium size block, let it be the precise width if possible. If a small one

is best to corner it or place it at the side rather than to let it in the centre of the type measure or width; this will facilitate the matter being set in short lines on either side of the block. To have the letterpress broken up into so many all lines is very distracting to the reader, and it creates that sore of wide or bad spacing.

One other thing to be avoided is the encroachment of literary illustrations on the margin, because this destroys the symmetry of the page and the proper balance of the two open facing pages. This does not, however, apply to systematic decoration, because anything in the way of a border may enhance the beauty of the page.

The placing of illustrations in bookwork is a very important matter—this being rendered more difficult if the volume is of small size. It is necessary that some consideration be made of the nature and size of the type employed. All this has an effect on the proportion of space between block and matter, and the position has been determined. If we take a dozen serious books of illustrated or decorative character we shall probably find as many varieties in treatment. No definite rules can be laid down; much must be left to the judgment of the printer, if not dictated by the editor or author.

One other point is the treatment of the necessary lettering of titles to those pictures. These vary a great deal, and one rule will not apply to all. If possible they should be dispensed with, but if they must be tolerated let these under-lines be dealt with in some intelligent way. If consisting of a short line of one line only they can be thrown into the white space of the margin, but if occupying more than one line they must be treated as part of the picture and allowed for, considering the space at command. Whether these letterings should be placed in the centre under the block or range at the side of the block is only a detail. A definite reason rather than rule of thumb should prevail.

One reason for the inharmonious appearance of books is that they are frequently put into hand before one has any notion of what is to come in the nature of MS., or the extent of the same. If it happens to be a volume that is to be illustrated no very defined notions are arrived at, but the MS. is flung to the printer with instructions to proceed in such and such a manner. The style of illustration may not be settled, or even the method of producing the same, and chaos is the result.

### BERKS ARCHÆOLOGICAL SOCIETY.

THE annual report of the Berks Archæological Society states that His Majesty the King had graciously consented to become patron of the Society, and the Bishop of Oxford had allowed his name to be associated with the Society as one of its vice-patrons. Funds having at length been provided by the careful and skilful finance of the hon. treasurer, the Society had been able this year to carry out to the full its undertaking with the Corporation. The basement room on the right of the Abbey Gateway, under the superintendence of Mr. Ernest Ravenscroft, had been adapted to the purposes required, and with the concurrence of the museum committee the librarian had been able to arrange there some objects of considerable interest. The year had been a fairly busy one in connection with the Society's operations. Five meetings had been held at Reading, when well-attended lectures were delivered. Two excursions took place, and gave much satisfaction to the members and friends who attended them. Detailed references were made to the various meetings and excursions, and to the visit of the Birmingham Archæological Society to Reading and Aldermaston, and to the discovery of urns at Sunningdale. The committee recommended that three guineas should be again voted to the Society of Antiquaries Exploration Fund, in connection with the Silchester Exploration. It was suggested that excursions be made during the summer to the following places:—(1) Westbury, Eddington and neighbourhood; (2) Hungerford, Littlecote, &c.; (3) St. Albans. It was hoped that a paper on "Excavations at Little Marlow Nunnery" would be read during the session by Mr. A. Vaughan Williams.

The following officers have been elected:—President, Mr. C. E. Keyser, M.A., F.S.A.; vice-presidents, the Very Rev. the Dean of Windsor, Lord Saye and Sele, the Ven. Archdeacon of Berks, Mr. Charles Smith, Mr. F. W. Albury, Mr. H. B. Blandy, Mr. James Parker, Mr. J. Okey Taylor, Mr. G. W. Mount, M.P., Mr. W. Berkeley Monck; committee, Mr. R. E. Golden, the Rev. A. Cheales, Mr. G. W. Webb, the Rev. Morris Williams, Mr. Challenor Smith, Mr. W. Ravenscroft, Mr. Theo. H. White and Mr. A. Ogilvie; hon. sec., the Rev. P. H. Ditchfield; hon. treasurer, Mr. W. Ravenscroft; librarian, the Rev. Alan Cheales.

The General Meeting of supporters of the Royal Architectural Museum and Westminster School of Art will be held on Thursday next at 4.30 P.M. Mr. W. Emerson will preside.

### TESSERÆ.

#### Minor Transepts.

THE chief peculiarity of general form in the English Gothic—viz. the eastern minor transept, so finely developed at Salisbury—has been called a useless excrescence; but it certainly, by the principles of contrast and multitude, adds to the apparent extent, and externally conduces not a little to variety and beauty of outline. We may account for its origin, however, thus:—In cruciform churches there were two modes of placing the choir and its furniture; either in the eastern limb, which was most common, or in the centre of the cross, as at Winchester, Canterbury, Westminster, &c. This place was especially proper when there was a lofty lantern over it, as in the Italian duomo and English cathedrals, but not in the French, in which accordingly there seems to be only one example of this arrangement, viz. at Rheims. This plan had the advantage of placing the choir in the most imposing spot, where alone the whole building displayed itself in five grand perspectives (the fifth being the tower, which was in all these cases originally open as a lantern); but it had the defect of shutting out the view of the transept arms from the nave and from each other, which latter was always the finest proportioned vista in the building, because not too lengthy for its other dimensions. But the builders of Salisbury seem to have aimed at combining the separate excellences of all other models, for it combines in its varied plan every kind of cross, the whole clerestory east of the tower forming even a Greek cross of perfect symmetry; and, notwithstanding the fine open view of the principal transept, on entering the choir we find it crossed by another transept, producing by its lateral views the same effect as in those choirs which are central. The hint was followed more or less completely at Worcester, York, &c.

#### Nicolas Poussin.

Poussin was of all painters the most poetical. He was the painter of ideas. No one ever told a story half as well nor so well knew what was capable of being told by the pencil. He seized on and struck off with grace and precision just that point of view which would be likely to catch the spectators' fancy. There is a significance, a consciousness in whatever he does (sometimes a vice, but oftener a virtue) beyond any other painter. His giants sitting on the tops of craggy mountains as huge as themselves, and playing idly on their Pan's-pipes, seem to have been seated there these 3,000 years, and to know the beginning and the end of their own story. An infant Bacchus or Jupiter is big with his future destiny. Even inanimate and dumb things speak a language of their own. His snakes, the messengers of fate, are inspired with human intellect. His trees grow and expand their leaves in the air, glad of the rain, proud of the sun, awake to the winds of heaven. In his *Plague of Athens* the very buildings seem stiff with horror. His picture of the *Deluge* is perhaps the finest historical landscape in the world. You see a waste of waters, wide, interminable; the sun is labouring, wan and weary, up the sky; the clouds, dull and leaden, lie like a load upon the eye, and heaven and earth seem commingling into one confused mass. His human figures are sometimes "o'er-informed" with this kind of feeling. Their actions have too much gesticulation, and the set expression of the features borders too much on the mechanical and caricatured style. In this respect they form a contrast to Raphael's, whose figures never appear to be sitting for their picture, or to be conscious of a spectator, or to have come from the painter's brush. In Nicolas Poussin, on the contrary, everything seems to have a distinct understanding with the artist; the very stones prate of their whereabouts; each object has its part and place assigned, and is in a sort of compact with the rest of the picture. It is this conscious keeping and, as it were, internal design that gives their peculiar character to the works of this artist.

#### Urn in Christian Churches.

About fifty years since in St. Olave's Church, Chichester, two Roman urns, of plain character, were found embedded in the wall above the arch of the east window. They were placed on their sides, with their mouths facing inwards towards the church, and there was some appearance of their having originally been open. For what purpose, or under what feeling, these urns were placed in this singular position it is difficult to conjecture. The fact would seem to tally well with the supposition that this was an ancient ecclesiastical site. The ashes or relics of martyrs might have been enclosed in these receptacles in early times, and the vessels preserved when, at a later period, the wall was raised and a new window inserted. Though, indeed, it is well deserving of consideration whether this curious discovery does not indicate a still more primitive origin than has been claimed for the singular arch which occurs in the lower part of this wall. It has been conjectured, by more than one able antiquary, that the aperture in question might be no other than part of one of the

ancient Roman columbaria. These were sepulchral buildings, having small apertures like pigeon-holes for the reception of urns. Such a one was discovered in the Appian Way, anno 1726, supposed to be that of Livia, the wife of Augustus. At what time or under what idea this sepulchral building, with its incurned remains, was adopted as part of the foundation of a Christian church must be mere conjecture. It is also conceivable that the remains may have been those of martyrs—martyrs of the days of St. Alban (about A.D. 303) perhaps, and fellow-sufferers of his in the days when Britain was still Roman.

#### Greek and Gothic.

The distinction between the two styles of architecture recognised in modern Europe is marked with sufficient clearness. The one soars to a great height and abounds in lofty vertical lines; the other attains but an inferior altitude, and abounds in prolonged horizontal lines. The one loves the complexity and combination of dissimilar parts, the other simplicity, symmetry and unity of outline. The one exhibits itself by deep shadows, the other by strong lights. It is not here meant to be denied that the Greeks produced effects by alternations of light and shadow, but their alternations were not nearly so great or so frequent as those of the Christian architects. They have no projecting transepts with dark angles, no huge buttresses—their mouldings and the capitals of their columns are convex, and never have the deeply cut recesses of our own styles. Their alternations of light and shadow are not abrupt, they avoid rapid transitions, sudden contrasts, bold projections and salient angles; the shadows melt away into light by softened and delicate shading. Respecting the characteristic distinctions of mouldings, vertical mouldings are almost (perhaps entirely) unknown in true Grecian architecture, whereas in Gothic they greatly predominate, and the horizontal, where they occur, take their character and form from the vertical. The one is essentially picturesque (in the artistic sense of the word), the other is statuesque. The one is the offspring of a wild and fertile fancy, the other is the production of disciplined and scholarlike art. The one is imaginative, the other intellectual; the uncontrolled sweetness of Shakespeare's versification and the studied perfection of Milton's metre do not differ more than do the modes of expression in Christian and Classic architecture. In all these characteristics (and the professional reader will suggest many more) the spirits of the two styles are widely different; but they are something more than different—they are antithetical—directly opposed to each other. The Pointed architecture is the exact antithesis of the Grecian.

#### Cruciform Churches.

Most churches present in their ground plan a cross of one or other of the following four varieties:—The cross without the summit, the cross with summit and but one transverse bar, the cross with summit and two transverse bars, and, lastly, the cross with summit and three transverse bars. The different forms of crosses with four limbs resolve themselves into two principal types—the Greek cross of the East and the Latin cross of the West—which types are again subdivided into many varieties. These types were originally common in both Greek and Latin churches, but eventually that which is known as the Greek cross prevailed in the East and the Latin in the West, and this applies in every sort of decoration where the cross is used, as well as in the forms of churches. In the earlier centuries of the Middle Ages the choir in the churches of the West was short, while the nave was proportionately long. After the thirteenth century the choir becomes longer, and there are even some churches in which the transept is nearer to the porch than to the apse. In some of the English churches the longitudinal nave is divided by two transepts—one in the centre, the choir being again divided into two equal parts by a second transept—shorter, however, than the first—the upper division forming the sanctuary, and the part between the two transepts forming the choir. In the decorative arts the varieties of crosses were yet more numerous than in architecture, and often present extraordinary peculiarities, some of which especially mark hierarchical distinction.

#### The Society of Dilettanti.

With the antiquities of Athens, the name of the Society of Dilettanti has been for the last century most intimately associated. Instituted in the year 1734, "by some gentlemen who had travelled in Italy, and were desirous of encouraging at home a taste for those objects which had contributed so much to their entertainment abroad," the first work it publicly produced, in 1769, was that which is well known under the title of "Ionian Antiquities," being a minute and scientific account of certain ruins in Greece, the remains of the Temple of Bacchus, at Teos, and others, under the superintendence of Chandler and Revett, assisted by the artist Pars. In the introduction to the "Ionian Antiquities," the following passage, explanatory of the principles of the Society, and in some measure serving as its introduction to the public, occurs:—"As this narrative

professes the strictest regard to truth, it would be disingenuous to insinuate that a serious plan for the promotion of the was the only motive for forming this Society. Friendly social intercourse was undoubtedly the first great object in view; but while in this respect no set of men ever kept more religiously to their original institution, they have not abandoned the cause of virtue, in which they are also engaged, or forfeited their pretensions to that character which is implied in the name they have assumed." To its valuable assistance, the Society was mainly indebted for the publication of the works of Athens which have made his name famous, and which, having guided and instructed the taste of our architects in the last century, are still the substratum of all modern knowledge in theory on the buildings of Greece. The issue of these important volumes took place at intervals from 1762 to 1816. Addressed to the Society in 1798 by James Barry, R.A., the high estimation which he entertained at that period of the influence over the taste of the public in matters of art. In the years 1809 and 1835 two volumes of another work by the Society appeared, entitled "Specimens of Ancient Sculpture," prepared after the example of the "Museo Pio-Clementino," by Visconti, in Italy, and in the same style as the concluding volume of the splendid Musée Française under Napoleon, with figures and descriptions of various pieces of antique sculpture in England, many of which were in the then Townley collection, but the majority in the cabinet of Mr. Richard Payne Knight. They were accompanied by an essay from the pen of the latter gentleman, "On the Symbolical Language of Greek Art;" and it was in connection with him, though not with one of his productions, that the Society was attacked by a malignant writer of the "Pursuits of Literature," in the notes to that poem; but Mr. R. P. Knight's personal quarrel was only part of the lampoon that survived its first publication, and that only in a few words of reply in the preface to his "Progress of Civil Society," 1796. In 1817 appeared "The Unedified Antiquities of Attica," under the auspices of the Society, chiefly relating to the temples at Eleusis, near Athens, containing not only the "bird's-eye views" of Sir William Gell, with the fact of which every reader of the "Childe Harold" is acquainted, but very elaborate and valuable measurements of the Propylæum of the temple at Eleusis, especially worthy of study, as having been formed on the model of the similar structure at Athens. The Society also published the important work by Mr. F. Penrose, M.A., entitled, "An Investigation of the Principles of Athenian Architecture; or, the Results of a Recent Survey conducted chiefly with reference to the Optical Refinement exhibited in the Construction of the Ancient Buildings at Athens."

#### English Staircases.

It was not till about the time of Elizabeth that staircases began to be planned more commodiously in this country, and made a decorative feature in the interior of a mansion. Even though they were greatly improved, the flights being made wider and the steps parallel to each other, with intermediate landings or resting-places between the several flights, and although considerable decoration was bestowed upon them, the walls being panelled and the parapet of the stairs formed either by richly carved balusters or open fretwork, frequently with heraldic figures of animals on the pedestals at the angles of the different flights, the staircase itself was usually enclosed within a comparatively small area, so as to admit of no general view of the whole of it, there being very little open space, well, as it is termed, sometimes none at all. The staircases at Aldermaston, Berks, Crewe Hall, Cheshire, and Knowlton, Kent, may be taken as examples of the kind. At a later period staircases in mansions of a superior class were made disproportionately spacious, being upon a scale as to size which the apartments themselves were not at all in keeping.

#### Pompeii.

What always surprises the visitor is the small scale of everything at Pompeii. The streets are very narrow, but have a high raised foot-pavement and two or three large stepping-stones at the crossings to enable the passenger to pass over dry-shod during rains. The shops and ordinary dwellings are of the most minute dimensions—literally too small "to swing a cat in"—and one is puzzled how the inhabitants could have stowed themselves away. Even the dwellings of the wealthier inhabitants are on a very limited scale; but then it is surprising how elegantly that small space is disposed. As in eastern countries there is generally an open court, with a fountain and a shaded portico around it, which was probably the general place of resort for the family, besides one or two inner chambers—the bedrooms being mere nooks and niches. The floors are everywhere inlaid with beautiful mosaic, at once cool and ornamental, the walls adorned with frescoes, which display both the love of art and the corruption of morals with which society was pervaded. A striking scene is the Forum, the heart of the city, and the great lounging-place of the inhabitants; extensive and

like the streets, very open, with an area surrounded by shady porticoes. The principal temples and the tribunal of justice rested upon it. If we climb an angle of one of these buildings and look down upon all this as upon a ground plan—these temples and porticoes being all roofless, though the pillars are standing—it is not difficult to repeople this vast and vacant space with all the mingled population of the city—patricians, plebeians, priests, senators, loungers, who were wont to congregate in the shade of its pillared corridors. Still more impressive is the great amphitheatre, where it is generally supposed the people were assembled at the very moment of the eruption. It is an immense oval, capable of accommodating many thousand spectators, and is still in a very good state of preservation. From the topmost bench there is a wide view over the bay and its shores, while Vesuvius looms up black and threatening in the background. Hence the catastrophe comes vividly home to the imagination; the mountain belching forth the torrents of lava that engulfed Herculaneum, the air black with the ashes that buried Pompeii, the horror and consternation of the inhabitants hurrying down amidst the suffocating mist to the shore of the bay to seek for safety in flight, at the same time that Pliny, crossing over from the distant shore of Sicily, perishes among the obscure crowd of fugitives; it is impossible to stand here and not to realise the terrible drama, the scene of which is so clearly unrolled around. But nowhere does it come home more painfully to the mind than in the dark underground vaults of the Villa of Diomedes, where the very press of the bodies of those who, taking shelter from the raining shower, as the hot dust penetrated deeper and deeper to its recesses, were there blocked up and suffocated, may still be seen upon the ash-encrusted wall.

#### Persian Gardens.

The prevailing plan of Persian gardens is that of long parallel walks, shaded by even rows of tall umbrageous planes, interspersed with a variety of fruit trees, and every kind of flowering shrub. Canals flow down the avenues in the same deviating lines, and generally terminate in some large ornamental basins of square or octagon shapes, containing sparkling fountains. Formal as this may seem, and therefore the reverse of picturesque, the effect was amazingly grand. The number of avenues and canals formed so extended a level scene that, when viewed from any point, it appeared as if a vast wood, with thousands of brilliant rills gliding amongst thickets. It should be observed that the Persians are not content with one fountain in a canal or basin, but often have many small low jets to keep the whole surface of the water in agitation and to heighten the sparkling effects through the foliage.

#### The Cone in Ancient Art.

In Assyrian sculpture cone-bearing figures are often found. They adorn, as deities, the entrance to peculiar chambers; within they appear in the more humble guise of ministers to the king's necessities, attendants upon the cup-bearer, as a drink purveyor and drink bearers, as also in the Xanthian fables and as guardians of the sacred tree. The cone by itself decorates the dresses worn by some subjects. Most of the cone-bearing figures have horned caps, or caps with horns, like the followers of Bacchus. Tradition attributes to the Median Bacchus the thyrsus, borne by the thyrsigers, or cone-bearers of Rome. All the cone-bearers carry a square vessel, which, from being sometimes decorated as a basket, has been very often looked upon, but erroneously, as such. Layard says it was often made of metal. With respect to the sacred tree upon which the cone-bearing figures are attendant, or from which they obtained their cones, in most countries the cedar or the cypress, it was in Assyria a pine, for the cone in the hands of Nimrod—the patriarch Asshur deified, according to Rawlinson—cannot for a moment be compared with the fruit of the cedar or the cypress, the connection between which and the worship of Venus in the systems of the East has been shown by M. Lajard, of the French Institute. On one cylinder, Darius, the "vivifier of mankind," is handing over a son and heir to a king in front of the sacred tree. What, then, was the connection between the pine tree and the pine cone, and the ceremonies of certain chambers, the "vivifier of mankind;" the worship of the Assyrian Venus, the tree of life, the sacred beverage of royalty, and the art of cookery? The answer is to be sought for in the uses to which the ancients applied certain products of the pine. Horace, in accordance with the popular opinion, attributed to it the power of insuring long life. The peculiar action of the essential oils derived from the different kinds of coniferæ or pinaceæ, including the pines, firs, spruces, cedars, cypresses, junipers, savins, &c., are well known to medical men. The celebrated Bishop Berkeley, in his well-known treatise on the virtue of tar-water, associated this vivifying or fecundating principle of tar with elemental fire held latent in the pine tree. Tar-water was, according to Plato, the second of the "ignited juices." Layard says, that the worship of the Assyrian Venus existed among the Assyrians

can scarcely be doubted. In later Assyrian times the attributes of the Egyptian goddess Isis got mixed up with those of the Assyrian Ashtaroth; and the lotus partly usurped the place in decoration of the cone, which appears to have been succeeded in the East by the fire cones of the disciples of Zerdusht or Zoroaster. In Asia Minor, Greece and Rome the cone became a mere ornament, except in the festivals of Bacchus, and the pine torch (*tada pinea*) was still carried at wedding festivals in the times of Catullus and Pliny.

#### Samuel Prout.

Born at Plymouth about the year 1784, like his fellow townsmen who have distinguished themselves in art, Prout owed little to the patronage of his native town, unless their share in the praises which he ultimately commanded may be counted to them as encouragement. In the Metropolis his first patron was Mr. Palser, the printseller, who at that time lived in the Westminster Bridge Road, who used to take all his water-colour drawings at low prices, and had a ready sale for them. When Mr. Palser removed afterwards to the corner of Water Lane, Fleet Street, and Mr. Prout had arrived at distinction, the latter never omitted grateful mention of the advantages he had derived from the acquaintance and transactions of the time. He early gained the notice of Mr. Ackermann, and the many drawing-books for learners, and other prints which he undertook for that gentleman soon gave currency to his name. His transcripts of Gothic architecture at home it is superfluous now to commend. When the allied armies had made it safe to venture to the Continent, Mr. Prout was among the earliest of the English to travel there. His love of the picturesque was gratified amid the new and remarkable combinations of form which met his eye at Nürnberg and in many of the adjacent cities. He was among the first English artists to add to what had been already made known of Venice by Canaletto. The annual exhibitions of the Water-Colour Society to which he belonged have testified to the skill and earnestness of eye and mind and hand employed on these to the last. Nor must it be forgotten that he was among the first when Senefelder's newly-discovered process was imported into this country to try his hand at it. The powers of the art of lithography—though its processes may have been improved and amplified amongst us since—were never better exhibited than in Prout's broad and vigorous touch. The Landscape Annual is another record of his powers. In representing foreign scenes, he gradually acquired that broad and conventional mode of representing distant architectural features which, though bold, was felt to be true, and was at once so new and gratifying to the general eye, that his powers of production were often unequal to the demands made upon them by the publishers. This great success, however, was confined to this peculiar branch; his trees were never successful, and his most beautiful effects are generally produced by light thrown upon a tower or high building in the middle distance, contrasted with the sky beyond. The groups in front of these architectural designs were always bright and cleverly arranged, and a symptom of mannerism has been noticed in the frequent smallness of the heads of these figures. Several engravings were published after his works, in line—the "City of Venice," a large mezzotint of "Chartres Cathedral" and coloured prints of the "Hôtel de Ville," "Louvain" and views of "Rouen" and "Ulm."

#### Christ's Hospital.

King Edward had very little to do with the foundation of Christ's Hospital. Both the house itself and the revenues for its support came from his predecessor, or were raised by the bounty of the citizens themselves, and we do not trace anything bestowed upon it in Edward's letters patent beyond the name by which it should be known. And that is nothing more than occurred in scores of other instances throughout the country, many a grammar school being named the school of Henry VIII., Edward VI. or Elizabeth respectively, merely because it was established (or in many cases remodelled) under authority derived from the sovereign. Moreover, Christ's Hospital was not founded as a school; its object was to rescue young children from the streets, to shelter, feed, clothe, and, lastly, to educate them—in short, to do exactly what in later times has been done by each individual parish for the orphan and destitute offspring of the poor. Any high-flown eulogies upon Edward's love of learning are consequently in this case wholly misapplied. It does not appear that he even assisted in what the citizens were doing at the Grey Friars. All that can be affirmed is that he was the founder of Bridewell Hospital, and that he recognised Christ's Hospital and St. Thomas's, which the citizens had already set on foot, the former having become their property by purchase. The story runs that the king's attention was directed to this good work by a sermon preached before him by Bishop Ridley in the year 1552, and that in consequence the king sent by the bishop a letter to the mayor, declaring his special commandment that the mayor should travail therein. There is no reason to doubt that the

sermon was preached, or that the amiable king was anxious to fulfil the part required of him, but this was not until after the citizens themselves had done what they could, and found that they required further aid from the Crown. Bishop Ridley himself, in his farewell letter to his friends, written shortly before his martyrdom, attributed the chief merit to the city magistrates: first, to Sir Richard Dobbs, in whose mayoralty the renewed effort was made, and who invited the bishop into the City council-chamber to advise with the aldermen thereon; and, next, to his successor, Sir George Barnes, whose "endeavour was to have a House of Occupation set up," and for that purpose procured the princely palace of Bridewell from "that godly king, that Christian and peerless prince."

### The Queen Victoria Street Fire.

SIR,—The sad loss of life at the General Electric Company's premises in Queen Victoria Street claims public attention in more than an ordinary manner. It is notorious that many office and warehouse buildings must necessarily be used temporarily for manufacturing purposes, and that individual rooms or floors have frequently to serve as workshops. Legislation, as it stands to-day, gives the public authorities considerable control over specific classes of buildings erected for specific purposes, but there is little or no control exercised as to the use of buildings or parts of buildings for purposes other than those for which they were originally intended. It is in such buildings that the congregation of a large number of workers becomes exceedingly perilous, and the sad loss of life on this and other occasions only too clearly shows the absolute necessity of greater severity in controlling the use to which such buildings are put.

The serious loss of life on this occasion, following so shortly upon a series of deaths in buildings partially used as business premises and partially used as tenements (we would here particularly refer to the fires at Hackney and St. Luke's), makes it evident that revision in the interests of human safety is required in more than one direction, *i.e.* especially in shops with dwellings above. Combined with this we have a number of large fires in which there has been no loss of life, but in which a vast quantity of property has been destroyed, as, for instance, in the Cripplegate and the Barbican and the dock centres. Our committee wish to urge most emphatically that fire prevention legislation requires revision, and that to make it effective it must be of a retrospective character. At the same time we should like to point out the personal responsibility which rests with the owners of the building and the employer of labour in seeing to the safety of the staff, and that this responsibility should be recognised and clearly defined by law.

It is not the intention of the committee at short notice to define what are the reasonable requirements to limit loss of life, but it is the opinion of the committee that a ready and easy means of escape should be provided from the upper part of every building in the County of London, both new and old—We are, dear Sir (on behalf of the British Fire Prevention Committee), yours very truly,

EDWIN O. SACHS, Chairman.

ELLIS MARSLAND, Hon. Secretary.

June 11, 1902.

### GENERAL.

**Mr. Aston Webb, A.R.A.**, was on Monday elected president of the Royal Institute of British Architects. None of his predecessors attained the distinction at so early an age.

**The Municipal Art Society** of New York have arranged a competition for a street electroliner and isle of safety for a crossing of Fifth Avenue, New York.

**M. Letellier**, the French contractor, has been enrolled in the Legion of Honour. Among his works is the Pont Alexandre III. in Paris.

**Mr. W. J. Wadham** has arranged to hold in the Royal Institute of Water-Colour Painters during the Coronation season a British Colonial Art Exhibition, to include works of the most eminent artists of the British colonies. It will be opened on June 13 by the Duke of Argyll.

**M. Tonquiau** has been appointed architect for the new theatre which is to be erected in Paris on the Boulevard, near the Rue Louis le Grand.

**Professor W. M. Flinders Petrie** was elected a Fellow of the Royal Society at the annual meeting.

**The Edinburgh Architectural Association** will tomorrow (June 14) visit St. Monans, Balcaskie and Pittenweem.

**M. Leygues**, Minister of Public Instruction in the late Cabinet, on Saturday distributed the prizes at the closing meeting of the Congress of French Architects.

**A Replica** of Mr. O. Ford's statue of General Gordon seated on a camel is to be placed temporarily in St. Martin Place, London, subject to the approval of the Office of Works. The statue will be sent to Khartoum in the autumn.

**The Musée des Arts Décoratifs** was officially opened last week. It is placed in the Marsan Pavillon of the Louvre.

**The Memorial** of the late Alphonse Daudet, the novelist by M. Saint Marceau, has been set up in the Avenue Gabrielle, Champs-Élysées, Paris.

**A Decree** has been passed by Oxford University providing for an expenditure of 730*l.* upon the repair of the balustrade and parapet of the Ashmolean building.

**The Italian Chamber** have adopted a Bill sanctioning the construction of an aqueduct from the Apennines throughout the province of Apulia. The cost of the undertaking is calculated at 8,000,000*l.*, of which the State and provincial authorities contribute 5,000,000*l.*, the balance to be furnished by the contractor in return for a 99 years' concession. Hitherto no tender has been forthcoming.

**A Memorial** is to be erected on the battlefield of Crécy to King John of Bohemia, who was killed in battle fighting against the English forces.

**Three Caves** have been discovered near Croydon about 14 feet in depth and 10 feet to 12 feet in breadth, one having a tunnel 4 feet high leading from it. Such underground chambers are common in Ireland and Scotland, but are rare in England. It has been suggested that they belong to the Neolithic age, and that they are prehistoric places of refuge. At present the only finds are a number of flints, some charcoal and a singularly perfect hammer-head, with a beautifully-drilled centre hole.

**The Memorial** to those Etonians who have fallen in the South African war is to take the form of (1) a record of names in the college chapel; (2) a commemorative monument in an appropriate position; and (3) a building worthy of the school including a library and hall.

**The London County Council** will make application to Parliament in the next session for powers to acquire the freehold of the leasehold portion of the site of the Pimlico Gas works and certain premises in Pulford Street, for the purpose of erecting an electricity generating station for the Council's tramways in the western half of London.

**The Hon. John Collier's** *In the Venusberg* has been purchased for the Southport Art Gallery. There was some opposition to the transaction.

**St. Oswald's Transept**, Chester Cathedral, will be opened on the 27th inst. The restoration has been carried out by Messrs. Thompson, of Peterborough, under the direction of Mr. Blomfield.

**The Cloth Hall** at Newbury has just passed from the Charity Commissioners into the hands of the Mayor and an influential committee, who intend restoring the building and converting it into a museum of local antiquities and an art gallery as the town memorial of Queen Victoria. This will cost more than 2,000*l.* The architect is Mr. Francis Mount.

**The Exhibition** of the sign-boards which have been prepared for the competition suggested by M. E. Détaillé, the painter, will be opened in Paris on November 1, and will continue until the 15th. The Municipal Council have offered 10,000 francs towards the prizes.

**The Duke of Connaught**, as Grand Master of the United Grand Lodge of England, will lay the foundation-stone of the new buildings of the Charing Cross Hospital on June 20 with full Masonic ceremony. Princess Louise (Duchess of Argyll), who is president of the hospital, has signified her intention of being present.

**The Foundation-stones** of St. Paul's new Congregational church, Standishgate, Wigan, have been laid in the presence of a large assembly. The old church was built 117 years ago, and in consequence of its decay it was decided to provide a new building at an estimated cost of about 6,000*l.*

**Holy Trinity** parish church, St. Anne Street, Liverpool, which was seriously damaged by fire in January last, has been reopened for Divine service after undergoing complete renovation. The damage done to the building by the fire has been repaired by Mr. W. Hall, under the direction of the diocesan surveyor, Mr. G. Bradbury, while the organ built by Gray & Davison has been in the hands of Messrs. Rushworth, of Mill Lane. In addition to these repairs other improvements have been effected.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## THE CORONATION.

**THE ARCHITECT will be published on WEDNESDAY, JUNE 25. All Advertisements, Tenders, and Contracts Open intended for insertion in that issue must be received at the Office, Imperial Buildings, Ludgate Circus, not later than 3.30 p.m. on Tuesday, June 24.**

## COMPETITIONS OPEN.

DEPTFORD.—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford, S.E.

HARTSHILL.—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Trent, invite designs for a home for nurses at Hartshill, Stoke-upon-Trent. Particulars may be obtained on application to Mr. Albert E. Boyce, secretary and house governor.

INDIA.—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

LIVERPOOL.—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

SUNDERLAND.—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

TOTTENHAM.—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

WEST HARTLEPOOL.—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson-Smith, clerk, School Board Offices, West Hartlepool.

## CONTRACTS OPEN.

ACTON.—June 24.—For erection of public baths in Salisbury Street, Acton. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton.

### THE RICHMOND HILL VIEW.

THE High Sheriff of Surrey, Mr. Max Waechter, has sent the following letter to the Mayor of Richmond:—

The Terrace House, Richmond, Surrey :  
June 5, 1902.

Dear Mr. Aldin,—As High Sheriff of Surrey, I contemplated giving a fête and fireworks in Richmond Park in celebration of His Majesty's Coronation, but by a lucky chance an opportunity has presented itself to commemorate that event in a form which will be more lasting and will benefit a much larger number of people. You will, perhaps, be aware that by the death of Mrs. Metchim, Petersham Lodge, which is the core of the Richmond view on the south side of the river, came into the market, and that to prevent this property from falling into the hands of speculators or speculative builders, I at once secured that part of it which belonged to the Metchim family. I have now come to terms with the owner of the remainder, the Earl of Dysart, and shall shortly be the owner of the freehold of the whole property.

I am about to grant a lease of the property to the Princess of Wales's Holiday Home for Governesses at a nominal rent, and subject to stipulations for the maintenance of the exceptionally fine trees on the estate and certain building restrictions. Subject to this lease, and subject to similar stipulations as to the maintenance of trees and restrictions of building, I desire to offer the freehold to the town of Richmond with the object of preserving the view from Richmond Hill. I think the conditions can best be arranged with your town clerk, and shall be happy to confer with him in case my offer is accepted by the Richmond Town Council.—Believe me, dear Mr. Aldin, yours very truly,

(Signed) MAX WAECHTER.

**ELECTRIC NOTES.**

THE arrangements for the leasing of the electric-lighting provisional order by the burgh of Hamilton, N.B., to Messrs. Edmundson, London, were finally completed at a meeting of Town Council on the 27th ult. It was stated that the total cost of the works had been reduced to £31,494.

MR. E. A. SANDFORD FAWCETT, one of the inspectors of the Local Government Board, held an inquiry on Friday last into the project for lighting Aston by electricity. It was explained by the clerk, Mr. J. Ansell, and the electrical engineer, Mr. Wilson, that the amount which it was sought to borrow for

electric lighting was £2,436. In reply to the inspector it was stated with regard to the generating station the foundations had been partly got out, the Council being under obligation to build the station for tramways, which were to be electrically equipped after the conclusion of negotiations for their acquirement. As to the financial aspect of the question Mr. Ansell remarked that the Council had had numerous applications from manufacturers asking when they would be able to be supplied with electrical energy and all pressing on the Council the necessity for making such a provision. There was no opposition.

AT the Cardiff electrical lighting committee's meeting last week the borough electrical engineer (Mr. Arthur Ellis) reported that for the year ending March 31 last the revenue had gone up from 11,153 $\frac{1}{2}$  to 15,515 $\frac{1}{2}$ , an increase of over 4,400 $\frac{1}{2}$ . The payments included 8,255 $\frac{1}{2}$  works cost, and 5,692 $\frac{1}{2}$  interest and repayments, and there was a surplus balance to the credit of the rates of 1,106 $\frac{1}{2}$ . The number of lamps connected had increased from 37,500 to 51,800, and the number of units sold from 688,000 to over a million. Now that they had exceeded a million, Cardiff was included among the big stations of the country. The total revenue worked out at 385 $\frac{1}{2}$  per unit for private supply, which was remarkably low. Cardiff was fifth on the list of stations as regards percentage of units sold to those generated. The report was regarded as extremely satisfactory, the Chairman pointing out that if they were trading as a private company they would have 6,798 $\frac{1}{2}$  to divide.

**TRADE NOTES.**

THE new isolation hospital, Chadwell Heath, is being warmed and ventilated by means of Shorlands' patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

THE warming and hot-water supply of Cholmondeley Castle have been placed in the hands of Messrs. John King, Ltd., engineers, Liverpool, employing their "Rahnee" radiators in the great hall and principal apartments.

THE inhabitants of Crakehall, Wensleydale, Yorks, have given instructions to Messrs. W. Potts & Sons, clock manufacturers, Guildford Street, Leeds, to erect a new hour striking clock in their parish church, to commemorate the Coronation of King Edward VII.

# WAPICTI

## A SANITARY

### WASHABLE DISTEMPER

#### OF BRITISH MANUFACTURE.

PRODUCES A MUCH MORE PLEASING EFFECT THAN FLATTED OIL PAINT, AT ONE THIRD THE COST.

"WAPICTI" can be made in any Tint, and is adapted for application to Plaster, Stucco, Brick, Stone, Cement, Wood, &c.

**FOR INSIDE OR OUTSIDE WORK.**

"WAPICTI" may be used over Oil Paint, or Oil Paint may be applied over it.

Manufactured by **ASPINALL'S ENAMEL, LTD.** New Cross, London, S.E.

IN preparation for the Coronation extensive alterations and improvements have been made at the Colonial Office, and included in these is a Waygood electric lift of the very latest pattern. This lift was specially ordered to be in time for the dinner given to the Colonial Premiers, and it is gratifying to know that this work was entrusted to an entirely British firm.

MESSRS. J. WEEKS & CO., LTD., of King's Road, Chelsea, have recently received orders to fix their heating apparatus in the East Galleries of the Victoria and Albert Museum at South Kensington, the extension of the lion house in the Zoological Society's Gardens in Regent's Park, and the new seed warehouse of Messrs. Jas. Veitch & Sons at the Royal Exotic Nursery, Chelsea.

MESSRS. ALLARD & CO., of 33 Jewry Street, E.C., have sent us a copy of their new and revised illustrated price list of office and shop fittings and furniture. It contains a large number of carefully drawn presentments of the various goods, and the prices, which appear to be very low, are clearly given. The information given, in fact, is so complete that from it one could with facility order the complete appointments for an office or, for that matter, for a suite of offices without the trouble of inspecting the goods themselves.

### BUILDING AND BUILDERS.

THE contracts for the new infectious diseases hospital at Scarborough have been let. The total amount is 10,540*l.*, a sum of 1,300*l.* less than the engineer's estimates.

THE foundation-stones of the new Primitive Methodist church in Leigh Road, Leigh, Lancs, were laid on Saturday afternoon.

THE present cottage hospital at Mexborough being inadequate for the requirements of the growing population, plans have been passed for an up-to-date structure, to cost about 7,000*l.*, towards which about 4,000*l.* is in hand.

THE June report of the Amalgamated Society of Carpenters and Joiners states that the total membership is now 68,321, the number on unemployed benefit 1,373 and on sick benefit 1,351. The majority of the Scottish branches report trade as fair. The branches in Pretoria and Johannesburg, it is added, have now been reopened.

AT a meeting of the Linlithgow School Board plans for the proposed new elementary school, in place of the burgh school, which was recently destroyed by fire, were submitted from two architects—Mr. Fairley, Edinburgh, and Mr. William M. Scott, Linlithgow. The meeting having considered the plans, unanimously agreed to accept that of Mr. Scott. The estimated cost of the building is 5,900*l.*

MR. S. BRIGHOUSE held an inquest last week at Warrington touching the death of Timothy Costello, sixty years of age, bricksetter's labourer, 37 Old Road, Warrington, who died from injuries sustained by a fall at Messrs. Gossage's Works, Widnes. It appeared that deceased and another man named Evans were engaged in the erection of a large chimney at Messrs. Gossage's works. Deceased was walking across a plank when he fell to the ground from a distance of 9 feet 6 inches, sustaining some fractured ribs. He was removed home and died as stated. A verdict of accidental death was returned.

MR. E. A. SANDFORD FAWCETT, Local Government Board inspector, held an inquiry at Aston on Friday last into the Council's application for 2,150*l.* for a branch free library at Aston Cross, in the course of which it was mentioned that since the year 1883 the Council had leased a house in the Lichfield Road, and at the present time that arrangement did not meet the requirements of the district, and a site had been given by Messrs. W. & E. Ansell. The amount now required to be borrowed was 2,000*l.* for building and 150*l.* for furnishing. No opposition was offered to the application.

THE foundation-stone of a building to be called the Queen Victoria Church Institute, and intended to meet parochial requirements, at Stoke-on-Trent, was laid on the 9th inst by the Bishop of Chester. The site of the institute is at the corner of Church Street and Booths Old Road, and the building will be erected by Mr. T. R. Yoxall (mayor) from the plans of Messrs. Lynam, Beckett & Lynam, at the contract price of 3,000*l.* On the ground floor there will be a lock-up shop, the principal entrance to the institute, and one side of the restaurant, with a frontage to Church Street, the main front of the restaurant, dining-room and large church room being in Booths Road. On the first floor there will be billiard, dining and tea rooms, and a gymnasium, and on the second floor the accommodation will consist of rooms for the Girls' Friendly Society, office, &c. The kitchens, cellars, and heating apparatus will be located in the basement.

THE new Talbot Lane Church, Rotherham, to be erected on the site of the old structure, which was destroyed by fire, will be in the Decorated style of Gothic architecture, with spire rising to a height of 125 feet, and is designed with nave and transepts and a chancel, which is two steps up from the nave, and in which the choir will be located, the organ being in a side recess. A gallery providing seating accommodation for 340 will run round three sides of the church, approached by two staircases in front, and two back staircases will also give access thereto. It is proposed to arrange a connection from the present schoolroom to the gallery. The seating accommodation on the ground floor will be about 500. A minister's vestry, choir vestry, and a third vestry are provided on the church floor level, whilst a large ladies' parlour 34 feet by 29 feet is arranged under the chancel, with lavatory attached, and a kitchen adjoining. The windows of the church will be of tracery of rich design and filled with ornamental leaded lights. The roof will be waggon-headed and of pitch pine, with circular cove plastered between the pitch-pine ribs. All the pews and other internal woodwork will be of pitch pine, except the pulpit and choir pews, which will be of oak. The warming will be by low-pressure hot water, and the heating apparatus will be placed under the minister's vestry and a little below the level of the church parlour. The ventilation will be by means of hopper inlets on Tobin's principle, the windows also will open inwards at the top; outlet ventilators will be put in the roof. The building will be faced with stone.

THE baths committee of the Carlisle Corporation have confirmed the recommendation of the sub-committee that the plans of the engineer for the proposed Turkish baths at a cost of 2,500*l.* be adopted, and, subject to the approval of the Council, they have instructed him to prepare bills of quantities and advertise for tenders for the work. The cost, 2,500*l.*, is 500*l.* more than the estimated cost of carrying out the plan originally approved of. The style of architecture which the engineer has adopted in drawing the plans is suggestive of the name which the baths are intended to bear, and both externally and internally the building will have a distinctly Oriental character. The baths will be of a nature suitable to a district like Carlisle, and under proper management they ought to become a very useful institution. The entrance will be by a passage 4 feet wide. It will be accessible to gentlemen through the second-class swimming-baths and to ladies through their slipper-bath corridor. There is a cloakroom at the end of the passage. The cooling-room is a building 29 feet 9 inches

square. It is provided with a plunge-bath in the centre. It has accommodation for fourteen persons, and there is provision for extra accommodation in the case of necessity. The plunge-bath is 21 feet long and 7 feet 6 inches wide and 4 feet 6 inches deep, and it forms a central feature of the cooling-room. The roof is domed over the circular end of the bath, and is secured by horseshoe shaped arches. There are three hot-rooms, one 20 feet by 16 feet, another 19 feet by 6 feet, and the third 8 feet by 6 feet. The shampooing-room is 17 feet by 11 feet 6 inches. A small Russian bath is provided. The building will be lighted by electricity, the whole of the walls and floor will be carried out in tiling, and special attention will be given to providing an efficient system of ventilation. The building will cover 52 square yards more than the building originally proposed to be put up.

### VARIETIES.

THE death is announced of Mr. Henry Kirke Hebb, late deputy town clerk of Lincoln.

THE opening of St. Andrew's Episcopal church, Niddrie, N.B., took place on Saturday. The church is seated for 250 persons, and can accommodate 300.

A NEW infants' department of the Roman Catholic school in Newgate, Pontefract, has been opened. The new building has cost about 2,300*l.*

MR. FRANK AUGUSTUS PRATLEY, chief sanitary inspector at Waterloo, near Liverpool, has been appointed surveyor and sanitary inspector to the Epsom Rural District Council at a salary of 230*l.*

At a special meeting of the Doncaster Town Council, on the 3rd inst., the recommendation of the Council in committee appointing Mr. R. A. H. Tovey town clerk and coroner, was on the motion of Alderman Pawson, carried unanimously.

THE death occurred on the 3rd inst. of Mr. Richard Hodkisson, of Leamington. The deceased, who was one of Leamington's most respected townsmen, was founder of the building firm of Hodkisson & Son, from which, however, he retired some fifteen years ago.

IT is announced that merchants have just distributed an order for 4,000 tons of galvanised corrugated roofing-sheet for shipment to South Africa, and that most of the contracts have been obtained by Midland firms. The orders represent

aggregate value of 45,000*l.*, and will give an impetus to the galvanised sheet trade of Birmingham and Staffordshire.

The parish church of Tidenham, Gloucestershire, was reopened on Sunday last by the Archdeacon of Gloucester, after careful restoration and improvement carried out under the supervision of Mr. Sidney Gambier Parry. Amongst other things, a carved oak screen has been placed across the tower arch. The interesting tenth-century leaden font has been put into a more prominent place on a beautifully designed stone base, and the organ of the church has been nearly doubled in size.

An inquiry was held on the 4th inst. by Colonel Slacke, J.E., inspector, Local Government Board, at Billericay, with reference to a scheme to supply water to sixteen parishes from well it is proposed to sink in the chalk. Evidence was given by Dr. Threch, D.Sc., medical officer to the county, by Dr. Carter, medical officer to the Council, and by Mr. Gordon V. Harris, M Inst.C.E. (Merryweather & Sons, Limited), the engineer of the scheme. The works will include duplicate pumping-engines, a reservoir at Billericay to supply the surrounding villages and a water-tower for the town service.

The Board of Education have decided, at the suggestion of the Council of the Society of Arts, to hold during the early part of next year an exhibition of engraving and etching in the Victoria and Albert Museum, South Kensington. The exhibition will consist of examples of copper and steel engraving, including line mezzotint and stipple (plain and coloured), aquatint and etching. The Board are being assisted in the selection and arrangement by an influential advisory committee, which held its first meeting at South Kensington on the 4th inst. All communications respecting the exhibition should be

addressed to the Secretary, Exhibition of Engraving and Etching, Board of Education, South Kensington, S.W.

At the last meeting of the Liverpool Estate committee it was resolved "that competitive schemes be advertised in the local and other suitable papers for the erection upon the portion of the George's Dock site, situate between the continuation of Brunswick Street and Water Street, of baths and tramway offices, and that an assessor be appointed to advise upon the selection of plans." It was also resolved that the architect of the selected design should be paid the usual fee of 5 per cent. upon the total cost of the work, but that the Corporation will appoint and pay their own quantity surveyor. The committee also agreed that premiums for the first three schemes considered best in the order of merit be awarded 200*l.*, second 100*l.* and third 50*l.*

THE new Roman Catholic church at Lowestoft was opened on June 5. It consists of a lofty nave with clerestory, supported on pointed arches and red granite columns, aisles, sacristy, lady chapel, morning chapel, sacristy and confessionals. Boldly moulded stone arches separate the sacristy and chapels from the other parts. An elaborate stone and marble high altar is erected in the sacristy, with five traceried two-light windows behind. Three entrances in front, and a massive square tower at one angle of front, having a staircase turret. Five-light tracery window in front gable. The church is faced with red brick with Costessey dressings, is Decorated Gothic in style, and has cost about 7,900*l.* for the church without seating. The architects are Messrs G. & R. P. Baines, 5 Clement's Inn, W.C., and F. W. Richards, 14 Stanley Street, Lowestoft. The works have been carried out by Mr. G. E. Hawes, of Norwich.

THE Belle Steamers having chartered three of their magnificent saloon steamers to run from Southampton to view the Fleet are taking the opportunity of carrying passengers who have no special taste for crowded railway travelling from London to Southsea and Southampton and back at an extremely moderate fare, viz. 12*s.* 6*d.* single and 21*s.* return. In addition to what will no doubt be a most enjoyable run, as the bookings are limited to a number that will insure travelling in comfort, passengers will get a fine view of the Fleet assembled at Spithead both going and returning. A steamer is timed to leave Fresh Wharf, London Bridge, at 6 A.M. on Tuesday, June 24, Thursday, June 26, and Friday, June 27, and will arrive at Southampton about 8 P.M. the same days. Arrange-

ments have also been made for through bookings from Fenchurch Street (L. T. and S. Rly.), *via* Tilbury, by the 6.25 train. Two of the steamers will return on Sunday morning, June 29 and the other on Monday morning, June 30, allowing return passengers from two to five days' stay at Southampton. Tickets and all information can be obtained from the Coast Development Company, Ltd., 33 Walbrook, E.C.

THE new swimming and private baths forming the extension to the public baths in Woodcock Street, Birmingham, were opened yesterday, the 12th inst. The new swimming-bath is 81 feet long and 30 feet wide, and leading from it are forty-eight private dressing-rooms, the openings to which are formed of terra-cotta courses, mouldings and arches. These give a very neat and pleasing effect to the building. The roof is supported on ornamental cast-iron ribs of special design, and the bathroom is well lighted by the introduction of a Muranese glass roof, in addition to a large window in each gable end of the building. The private bath departments consist of eighteen separate bathrooms, divided into three sections, and the floors are laid with mosaic terrazzo paving, with ornamental borders throughout, excepting in the case of the promenade round the swimming-bath, where a special border of ribbed adamantine tiles, 2 feet wide, has been laid next to the kerbstone in order that bathers may get a good foothold. A special needle and shower-bath has also been provided with the usual lavatory accommodation. The estimated cost of the buildings as sanctioned by the City Council was 11,000*l.*, which included 800*l.*, the cost of sinking a new borehole from the bottom of the existing well for the purpose of obtaining an additional supply of water to meet the demand caused by the extensions. This additional supply of water was amply secured before the baths and parks committee recommended the City Council to authorise the extension of the baths. The cost of the various engineering works included in the sum mentioned amounted to 950*l.* The buildings have been erected by Messrs. John Bowen & Sons, of Balsall Heath, from designs prepared by Mr. F. W. Lloyd, the architect appointed by the baths and parks committee.

COMMENCEMENT has been made with the new High-Level Bridge across the Tyne. The contractors, the Cleveland Bridge and Engineering Company, Darlington, have started operations at the south, or Gateshead side, and the north side of the bridge will be a little to the left of the present Central Station at Newcastle. In size and cost it will be the largest bridge undertaking in the United Kingdom since the Forth

Bridge was completed, the contract price being 470,000*l.* The existing high-level bridge, designed by Robert Stephenson, cost 49,000*l.* That bridge has three sets of rails, whilst the new bridge will have four, and will be solely for railway traffic. The present high level has also a roadway underneath for ordinary traffic. The new bridge will greatly relieve the congested state of the present bridge, and will enable express trains to run straight through from the north to the south without the inconvenient shunting back arrangements. The bridge will consist of two enormous spans of 300 feet each, across 600 feet of waterway.

THE directors of the Carlisle Race Stand Company have finally considered the eight sets of plans sent in for the erection of a grand stand on the new racecourse at Blackhall. The result of their deliberations was that the plan sent in by Mr. Joseph Graham, architect, Bank Street, Carlisle, was selected as the most suitable, and the second and third premiums of 10*l.* and 5*l.* respectively were awarded to Messrs. Mortimer Son, Lincoln, and Messrs. Manning, Newmarket. The successful plan shows a building of brick with steel framework, public stand to hold 2,500 people, conveniently reached from the enclosure by a 36-feet wide entrance of stone steps; and stand to accommodate 500 with separate divisions and separate entrances (1) for the county gentlemen and distinguished visitors, (2) stewards, and (3) members of the Press, owners, trainers and jockeys. The public stand will be partly and the private stands will be wholly protected from the weather. The rooms for the clerk of the course and other officials, jockey dressing-room, reporters' room and telegraph department will be in close proximity on the ground floor near the corner stand, and will be provided with rapid and convenient means of communication. The public stand will consist of a series of steps made of concrete and asphalt. The stewards' stand, which may be entered by a private way from their own room or by a private entrance from the enclosure, and the adjacent private stands occupy a situation immediately opposite the winning post, a point of which a good view is also commanded by the public stand. Overlooking the private stands is a tower which is ascended by a separate staircase, and which may be used by reporters, &c., who wish to watch the horses throughout the whole of the race, a thing they cannot do at present without inconvenience. The plans show a large luncheon room in proximity to the private stands and a large bar, 80 feet long. Subscribers, owners and trainers will enter the enclosure by an entrance in the centre of the building, and the

public by five turnstiles at the north end, adjoining which there will be pay boxes, secretary's office, strong-room and cloak-room, &c., with internal intercommunication. At the end of these buildings there will be a police station and latrines. The estimated cost of the work is 3,850*l*.

## THE DEVELOPMENT OF THE TIMBER TRADE OF AUSTRALIA WITH THE UNITED KINGDOM.

On Wednesday last Mr. Edward T. Scammell, F.R.G.S., delivered an interesting lecture on the above subject at the Australasian Club, 132 Leadenhall Street. Mr. E. T. Doxat, of the Australasian Chamber of Commerce, occupied the chair, supported by the Hon. H. B. Lefroy, Agent-General for West Australia.

After alluding to his paper on "The Timber Resources of the Australian Commonwealth," recently read at a meeting of the Society of Arts, the lecturer proceeded to describe the immense forest areas of Queensland, New South Wales, South Australia, Western Australia, and Tasmania, comprising a grand total of nearly 200 million acres, equal to the whole of the timber-producing areas of Europe, exclusive of Russia. What this might mean as an asset to the Australian Commonwealth, if rightly developed and controlled, it was impossible to say, and yet of the timber at present exported to the United Kingdom Australia supplies only 1 per cent, a ridiculously small proportion. The question therefore arose whether, being the great market which this country affords and the considerable timber resources of Australia, it was not possible to alter this state of things for the better.

Mr. Scammell next proceeded to give a brief sketch of the few Australian timbers that have to some extent obtained a foothold in this country, viz. the jarrah and karri of Western Australia; the blue gum, stringy bark and blackwood of Tasmania and Victoria; and the blackbutt and ironbark of New South Wales and Queensland. The principal use to which jarrah and karri have been applied in this country is street paving, but they are specially suitable also for many classes of engineering work. The principal English railway companies have, for instance, adopted karri for the decking of station platforms, goods sheds, bridges and piers, as, owing to its hardness, resistance to wear, durability and freedom from

knots, it provides not only a more satisfactory flooring, but in the end it is found to be more economical than fir or pine. Two of the principal English railway companies alone have ordered karri timber during the past eighteen months sufficient to construct from 12,000 to 13,000 waggons, while quite 100 miles of railways have been laid with karri sleepers. As pier timbers it is found that jarrah and karri are among the cheapest and best in the market.

In dealing with the special characteristics of Australian timbers, the lecturer drew attention to one point which was of considerable importance at the present moment, viz. their comparative non-inflammability, and the careful consideration of this subject was demanded on the part of all who were interested in the construction of fireproof buildings and of tube railways, tunnels, &c., where sleepers have to be used, or any woodwork, particularly where electricity is employed as the motive power. As jarrah and karri, as well as other Australian timbers, char rather than burn, buildings constructed with floors and joists of these woods would be practically fireproof.

It was further contended that no effort should be left untried to bring under the notice of the British dealer and consumer the special uses to which the products of the Australian forests were adapted. It was not claimed for them that they can supply the place of the soft woods of more northern climes, nor that they can supplant oak, teak, greenheart, mahogany and other hardwoods which are better known and more widely used; but in view of the rapidly decreasing supply of some of these timbers and of the uses to which Australian woods are specially adapted, there appears to be no reason why Australia should not do a large and increasing trade with the United Kingdom.

## DISCONNECTING DRAINS.

The report of Mr. Malcolm Patterson, engineer to the Bradford Sanitary Association, contains the following remarks on disconnection:—

Attention may be drawn to an interesting contribution to this important question by Mr. Walter Markham, who on February 12 last read a paper on "The Application of Disconnection," at the Institute of Sanitary Engineers. In the paper he doubts the need of any disconnection of wastes, and maintains that all dirty water wastes should be treated in the same way as soil-pipes; that they should be led into the

nearest manhole without the intervention of a gulley. In doing this, Mr. Markham impugns the whole scientific opinion of the day, and stands almost alone. This does not prove, *per se*, that he is wrong. He bases his revolutionary view, first, on the excellent principle that the object of drainage is the swiftest and most sanitary removal of soil and dirty water wastes from the centre of population; and, second, so far as can be judged from the paper, on his experience of the flat residences in the West End of London. Every trap or gulley which exists on a system of drainage is an obstruction to the flow of the sewage, which causes deposit and produces sewer gas, and also a hindrance to ventilation. Yet it does not follow that traps should be done away with. Indeed, the inside trap at the sink is acknowledged to be essential, merely needing ventilation; and the proposed abolition of the gulley is based upon the opinion that it is an unnecessary nuisance. A nuisance it is, if neglected, as often enough we find it; but the same must be said of the trap which is inside, and, being inside, some might think it the more offensive of the two. But, while in practice all experienced sanitary engineers have found that in the matter of waste pipes a single line of defence is often turned by accident, the defeat of the double line of defence, at one and the same time, is of the rarest occurrence; so rare, indeed, that, in the testing of many thousands of drain branches, over a period of twenty years, we have not yet had a single case.

Undoubtedly the flat system affects results, and must be reckoned with. It is here that the main outlet disconnecting gulley is so dangerous, a single trap often receiving the whole sewage of 100 people at the foot of a "common stair," where the drain pumps out its sewer gas at each flush. Here also a single person who misuses the upper wastes may cause a sickening nuisance to families below them. Like scum, the worst tenants rise to the top, and flats do not suffer the same facility of the handy discharge of slops as ordinary dwellings. Thus the aggregation of humanity in a small area—itsself a backward step of the most dangerous kind in modern civilisation—may render imperative some modification of the system of disconnection, which otherwise cannot be easily improved.

A further point was emphasised by the lecturer, namely, that his proposed treatment should only be applied on a complete scale, that is, not to a single dwelling, but to a section of a town, where sewers are adequately ventilated. This would demand action by the authorities not yet authorised by statute.

While approving of the principle which rules Mr. Markham's remarks, namely, that efficiency of discharge of putrescible matter is a prime object, perhaps the foreman I am of opinion that to cease all disconnections would be to carry theory beyond the control of practice. In these matters it is human nature we have to contend with, as well as natural forces of decay and accident. Practice convinces that, all things duly considered, the obstruction of solid excrement in large traps at the foot of a soil-pipe or the end drain is more dangerous than its free passage. It also convinces me that the obstruction of ordinary liquid sewage by self-cleansing gullies is less dangerous than its free passage, especially if we have regard to the difficulty of the safe removal of all our internal fittings.

No possible amount of sewer ventilation will render so air other than a poisonous air. All human work is imperfect and even that drainagework which comes nearest perfection is, and always will be, liable to be used imperfectly and perniciously. This fact is engraven on the minds of all those who have applied to their wisest theories the test of practice; and it teaches us the golden rule, never to expect a network of drains to be always working at their best, any more than any other invention of man.

### SOCIETY OF ENGINEERS.

A VERY interesting visit was made by the members Associates of the Society of Engineers on Wednesday, June 12, to the pumping stations and works connected with the water supply system of the Crystal Palace and the new roof over the central transept.

#### *The Crystal Palace Water System.*

There are few, if any, of the members of the Society who have not, at one time or other, paid a visit to the Crystal Palace, and it may be that there are equally few who, although fully appreciating the varied attractions of the building grounds, have ever bestowed a thought upon the multifarious engineering details which are necessary to the production and maintenance of those attractions. It was considerations of this kind which suggested the present visit of inspection, which permission was most readily accorded by the directors of the Crystal Palace Company. The inspection related mainly to

ing stations and works connected with the water system of the Crystal Palace, the following description of which is compiled from an article on the subject which appeared in the *Engineer* of February 1, 1901.

It will doubtless be a matter of surprise to all to learn that the extraordinary amount of water requisite for the needs of the Crystal Palace varies between 250,000 gallons and 300,000 gallons per day throughout the year. This is enough—at 100 gallons per head—for the supply of a town of from 8,000 to 10,000 inhabitants. This amount leaves out of account altogether any which may be used for dietetic purposes. Such water is obtained from another source than that from which the Crystal Palace supply is drawn. For the most part the Crystal Palace depends for its water supply upon the amount of rainfall collected from its grounds—nearly 200 acres, including the grounds of the Crystal Palace, which are available as catchment area—and supposing a rainfall of 25 inches a year, which is the amount calculated by the Meteorological Office, the total rainfall is over 117 million gallons. Of course, only a proportion of this is caught, and the actual amount used is about 90 million gallons. Some of this water is used twice over, so that the actual amount of water in circulation is less than this. In dry years the supply is not equal to the demand, and the mains of the Crystal Palace Water Company are drawn upon. The average quantity taken from this source is about 10 million gallons. In wet years it was between 13 and 14 million gallons—an expensive tribute for rain-water. Naturally enough, seeing the elevation of the Crystal Palace and the huge tanks at the southern end of the water company charges high rates for water supplied. In fact, the company does not care much about supplying at all when the price it charges—1s. per 1,000 gallons. Taken at this price the average expenditure of the Crystal Palace on water is some 500% a year, and the amount purchased forms but a little more than one-tenth of the total consumption.

The drainage from nearly all the land within the Palace boundaries falls by gravitation to the boating lake, which is, as a fact, the main storage reservoir. Its area is some 100 acres and its depth varies from 6 feet to 9 feet. Its surface is, on an average, 155 feet below the mean level on which the Crystal Palace itself is built. The tanks in the towers come some 100 feet above this again, a total difference of, say, 435 feet. The fall of 155 feet takes place in a distance of 800 yards. The slope of the hill is therefore very fairly steep. The ground, however, is of a retentive nature, holding the water to a large extent; moreover, the loss by reason of evaporation from the

numerous surfaces of water must be considerable. The total exposed surface amounts to nearly 15 acres. The various basins, for the most part, drain into one another in succession, but all the overflow water eventually finds its way into either the boating lake or the cooling pond. In order that it can be utilised, however, it is necessary that the water should be raised to a height from which it can command every part of the grounds and buildings. Placed on the top of each of the towers is a large circular storage tank. These are 47 feet in diameter, and they are provided with inverted funnel-shaped bottoms. The capacity of each is, with a depth of 35 feet, some 290,000 gallons. Some idea of the strength of these towers can be obtained by considering what this volume represents in weight—it is nearly 1,300 tons.

The water in the tanks at the top of the two towers is devoted almost entirely to reserve in case of fire, though some of it is used for blowing the bellows of the great organ, and some for actuating hydraulic lifts. The tanks are joined by two separate 8-inch cast-iron mains, which have fixed to them some fifty hydrants. The water in the two tanks, therefore, always stands at the same level, since there is open communication between the two. In these two tanks there is therefore a possible storage of nearly 600,000 gallons. The water is always at a pressure of about 120 lbs. at the floor level of the palace. At a height of some 80 feet above the level of the ground near the bottom of the north tower are two storage tanks. These tanks are each of them 48 feet square by 16 feet deep, and together they can hold some 460,800 gallons. There is, hence, a possible storage of water under pressure of over one million gallons, taking the towers also into consideration. Of course, however, the pressure of the water from the tanks—which to distinguish them from those in the towers may be called the lower-level storage tanks—is less than that from the towers, being only some 35 lbs. per square inch. A 15-inch main from these tanks is led through the building, where the water is used for general purposes. At the foot of the north tower is an irregular-shaped storage reservoir, which is capable of holding 5½ million gallons. Its area is about 2½ acres, and it can be filled to a depth of 9 feet. The water from this reservoir can be pumped into the lower-level tanks or into those in the towers, and it is also available for the fountains, but not, of course, for the buildings, since its level is too low. It is, however, 50 feet above the highest fountain and 124 feet above the lowest.

There is yet another source of water supply—the lower

pumping station. Here there is a well which is sunk through the superincumbent strata till it meets with water-bearing green sand at a depth of some 300 feet, and chalk at some 360 feet below the surface. Its total depth is about 250 feet, but three bore-holes 10 inches in diameter are sunk from the bottom of the well to a further depth of 250 feet, making the total depth to the bottom of the bore-holes some 500 feet. The bore-holes are cast-iron lined down to the green sand. The well is brick-lined for its full depth of 250 feet and is 8 feet 6 inches in diameter. At a depth of 150 feet there are four headings at right angles to each other. These vary in length, the longest being 30 feet, and are 8 feet 6 inches in diameter. Down in the well, at a depth of about 150 feet, is a set of three-throw pumps made by Hunter & English. The delivery from these is 4 inches in diameter, and is taken up to the reservoir, and a branch is also taken to the lower-level tanks. The ordinary water level in the well is at a depth of some 95 feet from the surface, and the totals of the lifts to the reservoir and the tanks are respectively 268 feet and 350 feet. The yield of the well is about 40,000 gallons a day, and when it was originally sunk it was intended to use the water from it for drinking purposes. It was found to be somewhat hard, however, as well as being rather saline—though otherwise of excellent quality. It is now only employed for general purposes. The drinking water used is obtained from the Lambeth Water Company's mains, and there is a tank near the south tower which is capable of containing 12,000 gallons of this drinking water. A 4-inch main takes the supply throughout the building. The amount used during the year is some 4,000,000 gallons.

The pumping machinery employed is of an antiquated pattern, and most of it dates from the earliest days of the Crystal Palace at Sydenham. In the north tower pumping-house, which is situated close beside the foot of the north tower, there is a pair of engines made by William—now James—Simpson & Co. These are of the beam type, and each has one steam and two hydraulic cylinders. The steam cylinder is 25 inches diameter, with a stroke of 42 inches. The pumps are of the bucket-and-plunger type. The larger pump cylinders, which are used for lifting the water from the reservoir to the lower-level tanks, a height of, say, 83 feet, have 19-inch buckets and 16-inch plungers, with 51-inch stroke, and the smaller cylinders, which are used for pumping the water from the reservoir to the tank at the top of the tower, a height of, say, 245 feet, have 14-inch buckets, 11-inch

plungers and a 28-inch stroke. Both these hydraulic cylinders are in the case of each engine worked from one end of the beam, but only one of the cylinders is in use at a time. Thus it is not customary to pump into the tower and up to the top of the tower at the same time. These engines bear the date 1853. They are in a good condition and are still at work. The steam to drive them is obtained from two Galloway boilers, 20 feet by 6 feet, which were put in in 1875, and work at 30-lbs. pressure. The engine work condensing, the condensers being of the jet form, a vacuum of 26 inches is obtained. The horse-power developed at twenty-two revolutions is about seventy from both engines.

Down at the lower pumping station there is a cross-compound double-horizontal pumping-engine. This is used for pumping water from either the boating lake or the cooling pond into the reservoir or into the lower tanks. The engine was originally made by Cox & Wilson—a firm now extinct—in 1853. Subsequently it was altered—the pump rams being reduced in size—by Thomas Middleton & Co. in 1887. The two steam cylinders are 35½ inches in diameter and have a 36-inch stroke. They drive direct the piston-rods of two double-acting pumps, the cylinders of which are 15 inches in diameter. The means of curiously shaped fork connecting-rods the piston-rods are also connected to the two cranks on a shaft carrying a fly-wheel, placed at the opposite end of the engine to the steam cylinders, and a jet condenser is worked from a crank connected to the piston-rod. The level of the boating lake is some 16 feet above the level of the pumps, and therefore, ordinarily, the pumps have the water supplied to them under this head of water. If, however, the pumps are drawn from the cooling pond, as sometimes occurs, this is not the case, and there is, on the contrary, a slight lift. The engine makes 14 revolutions a minute, and the pumps, as already stated, are double-acting. In a trial carried out not very long ago, this engine pumped 198,000 gallons of water into the lower-level tanks—a lift of 253 feet—in 3 hours 17 minutes. The 21-inch main runs from this engine-house to the reservoir, a distance of some 1,150 yards, and there is also a connecting pipe to the lower-level tanks. Jet condensers worked off the piston-rods are fixed under the engines, and the condensing water is obtained from the cooling pond.

The overflow, which in times of heavy rain takes place from the boating lake and cooling pond, is led away by a culvert which passes out of the Palace grounds near the main entrance, and eventually finds its way into the Ravensbourne

be a great saving if the storage capacity in the were greater, for then much, if not all, of this waste of could be prevented. The boating lake, however, is and not of natural formation, and it would be impos- raise safely its bank without very considerable expense. are now, as a fact, rather worse in this respect than since the cycle track, polo ground, &c., have been ted on the sites of what were once large reservoirs. their time did much by acting as subsidence reservoirs the water by allowing time for sedimentation before it the boating lake. Now, however, in addition to a storage capacity, the water in times of rain reaches the lake in a very turbid condition. In this condition, of it is sometimes necessary to use it.

engine for working the well pumps was made and by Easton & Amos—now Easton, Anderson & —in 1853. It is a compound vertical engine, working beam. The cylinders are 13 inches and 22 inches, and ke of the low-pressure cylinder is 50 inches. The of the crank is 25 inches, and the engine makes tions a minute. The pinion on the crank shaft has 1, the spur wheel on the pump shaft has 92 teeth, speed of the pump shaft is about 11 revolutions a The pumps are three-throw, the three barrels being ches in diameter, and the stroke is 2 feet. Both this larger pumping engine are supplied with steam from acashire boilers, 30 feet by 7 feet, made by Jones is, of Millwall. These work at 40 lbs. pressure, and it is to note that while the well engine is compound and ing—the jet condenser being used—the cylinders are ad, and the pressure is only 40 lbs. at the boiler.

tain amount of the water, when it has been used for purposes in the grounds, eventually finds its way back eating lake, and the cycle of operations is repeated. ater part, however, is lost by evaporation, absorption t ground or by being delivered into the sewers or the lvert. In spite of the antiquated nature of the pump- chinery it runs smoothly and well. The engines cer- ave not the appearance of having been at work for ifty years, and of having done a fairly heavy duty all e. Of course, as compared with a waterworks, the Palace water arrangements are not on a very extended ough there are at least 25 miles of piping of one sort mer connected with the water supply. Some of these e as much as 3 feet in diameter. What is remarkable,

however, is that there should be all this machinery in connec- tion with one single establishment, a circumstance which appears to be unique.

#### *The Centre Transept Roof.*

Forty-eight years ago, namely, in 1854, the Great Exhibition building of 1851 was reconstructed on the Norwood Hills at Sydenham, as the well-known Crystal Palace. The glass roofing, of which there is about 14 acres, is on the ridge and furrow system of Sir Joseph Paxton, the designer of the original exhibition building. The glass was placed in position upon the main framework of the roof by the alternate fixing of glass and sash bar, the latter resting upon the ridge timber at the upper end and upon the Paxton gutter at the lower. The glass was pressed home into grooves formed on either side of the sash-bars, which were coated with paint immediately before the glass was placed in position, the paint successfully taking the place of putty.

The maintenance of this roof in efficient repair proving a source of considerable expense to the Crystal Palace Company, it was resolved about three years since to reglaze the whole of the roofs, commencing with the great arch over the centre transept of the Palace, upon the "Eclipse" principle of Messrs. Mellows & Co., of London and Sheffield. To this end the iron main framing of the roof was left unaltered, but the old Paxton gutters and ridges were removed and replaced by new ones of wood covered with lead. The sash-bars consist of light T steel, entirely encased in a drawn coating of lead with an admixture of tin.

These bars spring from gutter to ridge in place of the old timber-sash bars, the lead being drawn with projecting strips on either side for embracing the edges of the glass. The sheets of glass used measure 51 inches by 18 inches, instead of 49 inches by 10 inches as formerly, and the weight is 26 ozs. per square foot, with 31-oz. glass on the crown instead of 16 oz. and 21 oz. In fixing the new glass neither putty nor paint has been used, and none will be required in maintaining the roof, the glazed area of which is about 2 acres. The lantern which surmounted the old roof was removed, and the new roof is completely semicircular. There is now practically no external surface which will require painting, and should any glass need replacing it can be done with a minimum of trouble and expense. The cost of maintenance is thus greatly reduced, especially when the comparative inaccessibility of the roof is taken into consideration.

## REGISTRATION OF TITLE TO LAND.

BUILDERS and others are often in doubt about the steps to be taken for complying with the Land Transfer Acts. The following information will therefore be useful :—

The procedure on an application to place a property on the register has been designed so as to cause the applicant as little trouble as possible. As a general rule, one attendance at the registry, with the purchase deed on which the application is founded, and a copy for filing, suffices for everything. The applicant is not required to draw up any formal application beforehand. No plan need be made by him. When the case is finished, the deed is returned to him, together with the land certificate, by registered post. On an average, the attendance takes from half an hour to an hour, provided the applicant possesses the necessary information to begin with, and either comes at a time when the office is not over full (that is to say, between eleven and one o'clock), or makes an appointment beforehand.

Each case is dealt with in four stages, involving visits to four different rooms, all on the same floor. These stages are—1. The Map Department reception room, where the applicant points out the property on the ordnance map, and gives the necessary instructions for the preparation of the filed plan; 2. The drafting room, where his deed is perused, the fees assessed, and the draft entries for the register are drawn up and submitted for his approval by a second-class clerk; 3. The stamp office, where he procures and affixes to the draft land registry stamps for the fees (a receipt is given if required); and 4. The registration clerk (third class), who accepts his deed and draft, and other documents, if any (giving a receipt if required), and formally enters the application and gives it its order of priority. The applicant then has nothing more to do, unless some question arises in the course of the registration.

As already stated, questions arise more frequently as regards the plan than as regards the legal features of the case. About 94 per cent. pass without any legal query; about 61 per cent. without query on the plan. Most of these are easily disposed of, as is shown by the number of cases that are completed in the course of a week or a fortnight.

Where special expedition is required, special efforts can be made to secure it. For instance, on one occasion application was made on a Friday morning to register one of the largest London theatres. The manager was starting for America on

the Sunday or Monday, and wished to take the land certificate with him. The plan on the deed did not agree with the ordnance map; this would usually have involved some delay waiting for one of the surveyors to be at liberty to investigate it. The solicitor, after explaining the circumstances, asked to be allowed to take a surveyor to the ground at once to investigate. They went off in a cab together, the surveyor returned and reported on the discrepancy, the plan was altered, the register and land certificate were made up, and the deed and certificate were handed to the solicitor on the following (Saturday) morning. Nor is this by any means an exceptional instance of what can be done where the applicant is willing to furnish the necessary information, and has reasonable grounds for exceptional treatment—such as the pendency of other transactions, which cannot go on until the registration is complete.

The subsequent course of the application inside the registry is somewhat complicated, owing to the numerous details through which it has to go: its main features are these: the preliminary work done with the applicant as already described :—

1. After acceptance of the application, various particulars of the case which it is found useful to preserve in an accessible form—e.g. the parish, the name of the property, whether freehold or leasehold, its value, the fee paid, the name of the solicitor, and any special directions as to the return of the deeds left with it that may be necessary—are entered in a book kept for the purpose. At the same time the deed, the copy, the draft entry, and every document connected with the matter is stamped with the number of the application, the date of its reception in the registry; a suitable number of loose blank pages to form the register are added, and the register and envelopes are prepared which will be required for despatching the land certificate and other documents when the registration is completed. The whole is then placed in a large envelope marked outside with its number, and is sent forward to the next stage. These things are done mainly by boys. The original deed is sent to the Map Department to be used by the surveyors in the preparation of the plan.

2. The second process consists in the checking of the draft entries. It must be remembered that the original draft is sent under a certain amount of pressure as regards time, in order not to keep other applicants waiting. This causes inaccuracies occasionally, and sometimes, too, failure to notice less obvious points which call for special notice. It has

found useful to submit every draft to the perusal of an officer (a first or second-class clerk), who has full time to attend to all details, and to consider the sometimes lengthy and complicated deeds on which registrations are based, and to make any observations as to points of law which may arise to them.

The draft, after being checked, is submitted for final approval to an assistant registrar, who looks it through to see that it conforms generally to the established practice, and considers any observations made during the second stage, and sends it forward for completion or directs it to be held for further consideration or inquiry as he thinks desirable. Correspondence with the applicant appears necessary in some cases or directs it. This occurs in about 6 per cent. of the cases.

The next stage is conducted in the Scrivenery Department, where the actual registers are prepared, and land certificates, and the cards for the name of the land are prepared. All entries, both in the register and in the cards, are type-written, a special machine which makes bound volumes being used; the register and the cards, and a third copy for storage in case of fire, are typed and bound. These are examined with the drafts before they are sent to the Scrivenery Department.

The four processes occupy as a rule three or four days. When the papers are complete, the papers are placed in their cases for the return of the deed and the plan for the land certificate to the Map Department.

Meantime, simultaneously with the above processes, the Map Department has been preparing the filed plan, and a card for the land certificate. The Map Department is divided into six sections, each with a superintendent and staff of clerks, draftsmen, and assistants. Each section deals with a particular portion of the county, and is familiar with its peculiarities. The procedure is as follows:—

The original deed and the instructions given by the applicant are placed in the reception room, and the filed plans of all registered properties for comparison, are sent to the superintendent who (or his assistant) at once gives them a preliminary inspection with a view to seeing whether any difficulty seems likely to arise in the preparation of the plan. If no difficulty is likely to arise, the case is marked "simple," and is dealt with rapidly; if otherwise, a note is sent to the applicant informing him that a question has arisen, and that there may be some delay.

2 a. The "simple" cases are dealt with as follows:—Each plan is executed in triplicate. One copy is filed in the office, another is to be attached to the land certificate, a third is put away in a strong room in case of loss or destruction of the first. The cutting out and preparation of these three plans from the Ordnance survey sheets, or, if those are out of date, the Land Registry revised lithographed tracings is carried out by a boy and an assistant draftsman; the plans are then carefully examined and checked with the deed and identification by the superintendent or his assistant, and are submitted to the chief superintendent or his examiner for final approval. These processes usually occupy about two and a half hours.

3 a. The cases of difficulty are dealt with by a different set of men so as not to interfere with and delay the simple ones. The first step is to send a surveyor to the ground. Not unfrequently the difficulty is cleared up by this alone, and the case is then proceeded with as "simple." Where, however, the surveyor's report shows a substantial doubt as to the identity, extent or configuration of the property intended to be registered, the applicant is written to, and the doubt is cleared up. If any question of law arises, the matter is referred to an assistant registrar for directions. When all is settled the plan is prepared (in triplicate), checked and compared with the documents by the superintendent personally, and forwarded, with all the correspondence and notes, to the chief superintendent for final approval. These cases occupy on an average about six hours of official time, but of course, where there is correspondence, considerable intervals sometimes intervene between the issue of a note or letter and the receipt of a reply to it, and at busy periods of the year, notwithstanding the frequent application of overtime work, cases otherwise ready to be dealt with have to await their turn. If special expedition is required it can nearly always be arranged for.

4 a. Every plan is finally examined and approved by one of the two chief superintendents or his examiner—cases of special difficulty by the former always. The case is then returned to the reception room, the property is marked on the general index map—freehold or leasehold as the case may be—the plans and relative papers are filed, and the case so far as the Map Department are concerned, is finished.

Returning now to the point at which we left the application above:—

5. The land certificate plans and deeds return from the Map Department in batches—several batches each day. These

are sorted and placed with their corresponding papers by boys. The land certificate is then made up, with its plan, and sealed, and the entire matter—register, certificate and all ancillary documents—is re-examined by third-class clerks, to see that no mistakes have been made, that the documents are duly marked and addressed to the right persons, and, in fact, that the case is ready in every respect to be completed.

6. The assistant registrar then signs the certificate, and finally looks over the documents; the certificate and deeds are sent off under the superintendence of a second-class clerk by registered post to the persons entitled to them, being checked with the book mentioned in the first stage, where also the number of days occupied in the case is noted. This is done as a rule on the evening of the day on which the plan is returned from the Map Department.

7. Various minor details in connection with filing the registers, drafts, index-cards and other ancillary matters, checking the receipts for the posted documents and inquiring after those that are not acknowledged, &c., all of which require care and attention, are carried out mainly by boys as soon as possible after the completion of each case.

On an average between fifty and sixty such applications, besides almost as many dealings with registered land, pass through the office every day. At busy times, just after quarter days, over 100 first registrations are sometimes received in a day, and dealings in proportion.

These processes have been found by experience to be on the whole productive of a good standard of accuracy, and not unduly to interfere with expedition. Time being so important a feature in all proceedings, there must, of course, be a limit to the multiplication of checks. Individual responsibility for correctness at every stage is probably in the end a more effectual, as well as a more economical, system than numerous examinations of one man's work by another. Every stage of each application is authenticated by the initials of the officer who is responsible for it, and all inaccuracies discovered are thus brought home to the persons in fault.

#### IN OR ABOUT A FACTORY?

IN the Court of Appeal on the 5th inst. the Master of the Rolls and Lord Justices Mathew and Cozens-Hardy had before them the case of *Holmes v. Birmingham Tramway Company*, which was an appeal by John Wall Holmes, the applicant, from a

refusal of the learned County Court judge at Birmingham award him compensation under the Workmen's Compensation Act. It appeared that in connection with the tramway at Birmingham repairs were executed in the sheds from the cable is worked. The machinery in the premises tuted the place a factory. The cars when not in use w stored in these premises. Owing to the cable no applicable to a small strip of line at the entrance premises, a locomotive was used to draw the cars up engine broke down when in the act of bringing a car shed on May 20 last, and the plaintiff, who was er in the factory, was ordered to execute the ne repairs. Having finished the work, the man upon the engine. Unfortunately the coupling the engine and the car broke, and the plaintiff's f crushed between the two vehicles and had to be am The point raised was whether the accident happened or about a factory" within the meaning of the Ac County Court judge held that as it occurred some 11 from the premises the accident could not be found happened "about" a factory within the meaning of t and accordingly he refused to award compensation. now contended on behalf of the appellant that the judge misdirected, and that he ought to have taken in sideration the question whether the plaintiff at the time accident, being engaged on the main business of the could be said to have been in that sense within the r of the Act.

The Master of the Rolls found that the County Court had directed himself in strict conformity with the deci the Court of Appeal. The Court of Appeal had laid that the fact of a man at the time he met with the being in mere physical contiguity to a factory was not s to bring the case within the meaning of the words "in a factory," although it had been held in another case accident which occurred outside a warehouse, but on perty of the warehouse proprietor, happened about a In the present case the accident occurred over 100 yar the factory and in the public highway. As to the co that the workman could be said to be "about" a because he was engaged on the business of his master met with the accident, he was of opinion that it coul maintained.

Lord Justices Mathew and Cozens-Hardy concurred the appeal was accordingly dismissed, with costs.

ssity that contractors and their foremen should exercise the greatest possible care to prevent accidents and liability lives by reason of injury to workmen in their employ ified by a decision recently given by Mr. Justice in the Superior Court at Montreal, in the case of eageau v. J. B. Martineau. The plaintiff claimed damages for the death of her husband, David a builder's labourer in the employ of the defendant, was killed while assisting in the operation of a an electric shock caused by the cable of the derrick to contact with an electric-light wire just beyond the from which building materials were being loaded on k and carried back some 25 feet for use in the build-church. The evidence showed that some days prehe accident the foreman received a shock, and ordered be put on the sidewalk to indicate the point beyond tray of the derrick should not be allowed to go, but was not so arranged as to prevent the tray from and it. The judge laid special emphasis on this fact, that it constituted gross carelessness on the part of an. For the defence it was contended that Gauthier ved no orders to assist with the derrick on the morning ident, but did so of his own accord while waiting for ns. The judge ruled out this plea on the ground that ad been assisting with the derrick on the previous had received no instructions that he was not to resume r duties. Judgment was given in favour of the for the sum of 2,500 dols.

## NILE DAMS AND RESERVOIRS.

ity last a lecture was given by Sir Benjamin Baker, he Royal Institution. He said that Mr. Cecil Rhodes stmas when riding across the hot and dusty desert Aswân and the Nile reservoir works incidentally that, after all, there was no climate like England's; r rain, why, it did good and hurt nobody. Glancing t the apparently limitless desert on all sides of them, and valleys, beautiful in form, but doomed for all time of uniform burnt-brick hue, bare of trees and of the ured growths which adorn a rainy country, one could reflect how puny were the efforts of man when

attempting to combat any decree of nature. The desert lands of Egypt would remain desert however many millions of pounds were expended in Nile reservoirs. All that man could do was to extend somewhat the narrow strip of green running along the banks of the Nile, and to render that and the other low-lying lands more productive than they were at present with a scanty supply of water. The Nile reservoir at Aswân would contain over 1,000,000,000 tons of water—more than enough water for one year's full domestic supply to every city, town and village in the United Kingdom with its 42,000,000 inhabitants. The great Nile reservoir and dam at Aswân, the barrage at Asyût, and various supplementary works in the way of distributing canals and regulators were designed with the object of mitigating the existing evils, by supplying in summer a larger volume of water at a higher level in the canals, so that not only could more land be irrigated, but that labour in lifting water would be saved. By far the most important of the works constructed to enable the water stored up in the great reservoir to be utilised to the greatest advantage was the barrage across the Nile at Asyût, about 250 miles above Cairo, which was begun by Sir John Aird & Co. in the winter of 1898 and completed this spring. In general principle this work resembled the old barrage at the apex of the Delta; but in details of construction there was no similarity, nor in material, as the old work was of brick and the new one of stone. The total length of the structure was 2,750 feet, or rather more than half a mile, and it included 111 arched openings of 16 feet 4 inches span, capable of being closed by steel sluice-gates 16 feet in height. The object of the work was to improve the present perennial irrigation of lands in Middle Egypt and the Fayoum, and to bring an additional area of about 300,000 acres under such irrigation by throwing more water at a higher level into the great Ibrahimiyah Canal, whose intake was immediately above the barrage. The piers and arches were founded upon a platform of masonry 87 feet wide and 10 feet thick, protected up and down by a continuous and impermeable line of cast-iron grooved and tongued sheet piling, with cemented joints. This piling extended into the sand bed of the river to a depth of 23 feet below the upper surface of the floor, and thus cut off the water and prevented the undermining action which caused so much trouble and expense in the case of the old barrage. The height of the roadway above the floor was 41 feet and the length of the piers up and down stream 51 feet. The river bed was protected against erosion for a width of 67 feet up stream by stone pitching, with clay puddle underneath to check

## Best Award of the Sanitary Institute, Three Silver Medals For "THE CLOSET OF THE CENTURY," WITH SYPHONIC DISCHARGE.

Combines the simplicity of the Cottage Basin and Trap with the advantages of a Valve Closet without the Mechanism.

Depth of Water, 6 inches. Seal in Trap, 3 inches. Surface Area, 12 inches by 10 inches.

In White or Decorated Earthenware, Strong Fireclay or Enamelled Iron, at prices to suit every class of building. No possibility of Syphonage by Discharge of Slops, yet complete removal of contents after use. Special Form of Patented Outlet Joint, securing an absolute and permanent air-tight connection to Lead Trap above or below floor level. Special Flush and After-Flush, Quick-Filling and Noiseless Cistern of simple construction.

This Closet has been adopted in Windsor Castle, Buckingham Palace, the residence of the Marquis of Salisbury, the Surveyors' Institute and Institution of Civil Engineers, Westminster, the Hôtel Cecil, Broadmoor and Hanwell Asylums, the various Railway Stations, and public and private Buildings of all kinds.

infiltration, and down stream for a similar width by stone pitching, with an inverted filter-bed underneath, so that any springs which might arise from the head of water above the sluices should not carry sand with them from underneath the pitching. The Aswân dam was not a solid wall, but was pierced with sluice openings of sufficient area for the flood discharge of the river, which might amount to 15,000 tons of water per second. There were 180 such openings, mostly 23 feet high by 6 feet 6 inches wide, and where subject to heavy pressure when being moved, they were of the well-known Stoney roller pattern. The total length of the dam was about  $1\frac{1}{4}$  mile, the maximum height from foundation about 130 feet, the difference of level of water above and below 67 feet, and the total weight of masonry over 1,000,000 tons. Navigation was provided for by a "ladder" of four locks, each 260 feet long by 32 feet wide.

It was easy enough to design dams, but not so to construct them. Fortunately, since our reconquest of the Soudan and the establishment of telegraphic communication, floods could be foreseen almost exactly and provided for. The work had to be so timed as not to be swept away by flood. The busiest months were May and June of 1900, when, in the race against time, the average daily number of men employed was 13,000, although the temperature rose to the height of 118 degrees. Messrs. Aird had done their huge task to the entire satisfaction of the Egyptian Government and of everyone with whom they had been associated, and the same recognition was due to Ransomes & Rapier, who were called upon to complete all the complicated machinery of sluices and gates one year under contract time and did it. In conclusion, the lecturer showed the photographs of numerous personages concerned, and devoted his closing words to eulogy of Lord Cromer, the selector and trainer of two such distinguished sons of the Empire as Lord Milner and Lord Kitchener.

#### ELECTRICITY IN MANCHESTER.

AN important addition to Manchester's electric power was made on the 27th ult. with the inauguration of the new generating station in Stuart Street. This new station covers an area of  $8\frac{1}{2}$  acres. Within the building there are to be two installations—the present installation of 15,000 horse-power, devised by Dr. Kennedy, and a second installation of 12,000 horse-power, in

accordance with a scheme of extension prepared by Mr. Metzger after his appointment as chief engineer in 1898. Under Dr. Kennedy's scheme six 2,500 horse-power alternator sets are being installed, in addition to two water-tube boilers and other plant. Three-phase alternating currents of a frequency of 50 cycles per second are generated at an "extra high pressure" of 6,500 volts, and are transformed at this pressure to the substations. The supply from the stations is at 500 to 550 volts pressure for supply to the tramways, and at 410 and 205 volts pressure for lighting and other purposes. The buildings at Stuart Street consist of a framework filled in with walls of brickwork. This design has been adopted, in the first instance, in view of the importance of completing the works with all possible speed. The boiler pump-room and engine-house are all on an extensive site. Workshops will be provided in a separate building which will be placed a large storage feed-tank to contain 500,000 gallons of water. In connection with this scheme substations are being erected upon the south side of the city. In order that sufficient power might be available for the Hyde Road and Stockport Road tramways on the special efforts have been made to complete the 250-foot chimney (another chimney 250 feet high will also be erected to the north and centre bays of the boiler and engine-house, and certain portions of the plant which they contain, as the substations at the Polygon, Bennett Street, Levens, Heaton Norris and Denton and the cables connecting Stuart Street and the substation. Under the scheme of Mr. Metzger two machines of 6,000 horse-power each, the largest of the kind and type in England, are to be put down. The buildings required to house this additional plant are, however, of sufficiently large dimensions to accommodate 24,000 horse-power. These buildings, which have not yet been erected, will be similar in character to those already described, and additional substations are to be provided in connection with this installation. When both schemes have been completed the total horse-power available at the various works of the electricity department (Dickinson Street, Bloom Street, Stuart Street) will be 58,000 horse-power, and 360 miles of cables will be needed to transmit the current. The tramway committee alone will require current for 800 cars, and lamp connections will amount to half a million eight candle-power lamps. It is expected that the amount of electricity consumed during last year (10,502,299 units) will be nearly doubled during the next twelve months.

## THE WEEK.

THE chairman of the Fire Brigade committee of the London County Council offered some explanations at the meeting on Tuesday which should be recorded in order to make it clear that the committee have not been so inefficient as is generally imagined. In the first place, it was said that the hook-ladders which had been in use for some time in America and on the Continent were tried, but were found to be inapplicable in London. It was also shown that the City was not entirely deficient in aids and appliances. There were three horsed escapes at Redcross Street, Bishopsgate and Whitefriars stations, and manual capes at six street stations; there were long ladders at Whitefriars, Bishopsgate and Redcross Street. Provision is made for fires at St. Bartholomew's Hospital, and certain recommendations as to outside ladders were the result of an inspection by Captain WELLS in 1897, but neither the Council nor the Fire Brigade was responsible. Since 1896 the protection of the City from fire had not improved still, but had been improved in many ways. Station accommodation had been largely increased. Where there were three steam fire-engines there were now six; one horsed escape had been increased to four, one long ladder to three, eight horses to twenty, and fifty-seven men to sixty-three. While the chairman's explanations deserve attention, there can be no concealment of the fact that the system failed under the last deplorable test, and that on preceding occasions the force of the Brigade was insufficient to overcome the evil.

FEW strangers when visiting Paris have the courage to explore the region where is the Arène de Lutèce. Yet the spot is not far from the Jardin des Plantes and the Lille aux Vins. There seems to be little doubt it was a Roman creation where combats between gladiators, or between wild animals, may have often place. The existence of the arena was forgotten until 1870, when in the course of the construction of the new street which was to bear the name of MONGE, the mathematician, the remains were discovered. The whole of the arena has not been exposed, and it may therefore be assumed that the citizens of Paris are indifferent to the old masonry, which we must suppose requires the exercise of imagination from a spectator to attain effect. An effort is about to be made which will help to render the place attractive. The actors of the Français generally travel once a year to Orange in order to give representations of plays, of which the subjects are classic, in the old Roman theatre. Why should not similar experiments be conducted in Paris? An appeal has been addressed to the Municipal Council for permission to give a series of representations. The proposal was received most favourably by several members of the Council, and it is now under the consideration of one of the committees.

THE ornaments of gold which were recently found in London and purchased by the Trustees of the British Museum for 600*l.* have been again made the subject of a Parliamentary discussion. The law officers in Ireland as well as in England have declared that the British Museum is not the place for their exhibition, but rather the museum of the Board of Education in Dublin. The Trustees are, however, fortified by legal opinion in their resolve to retain the objects which they have bought. The remarkable spectacle presented that the Crown authorities have commenced legal action against the Trustees of the British Museum in order to have these ornaments declared to be treasure trove and the property of the Crown. If that declaration was obtained the result would be that the objects must be removed to Dublin. The Treasury thought the case was one in which the costs of the Trustees of the British Museum in defending the suit might fairly be met out of public funds on one side as on the other. Technical assistance has been prepared to support the case of the Trustees, but it is doubtful if the action can be heard before

the long vacation. On the other hand, it has been said that the ornaments are not Celtic but were captured during a raid in England or on the coast of Gaul. In that case there would be less reason to place them in Ireland. The action will probably cost ten times the amount paid for the treasures, and the only point at issue seemingly is whether the objects are treasure trove or not. We have so often referred to the ornaments, it seems hardly necessary to repeat that they consist of a boat, a bowl, two chains, two twisted neck-rings and a hollow collar. The last is the most important. It is  $7\frac{1}{2}$  inches in diameter, and is formed of two repoussé plates of thin gold, folded over in a tubular form and soldered together. Particular attention was directed to the fastening, which is remarkable, a fixed projection at one end catching in a slot at the other, and in order to unfasten the collar when thus locked one half has to be turned at right angles to the other. The collar is beautifully ornamented, and has on it repoussé work and fine engraved lines, the whole design being done by a compass, which was much used in Celtic ornament, but in this instance the result was unique of its kind. At the back of the collar on one side is a complete circle, with the point of the compass in the centre. If the Government should obtain judgment in their favour there is no doubt the ornaments will be sent to Dublin. At the same time they are likely to give gratification to a larger number of British and foreign archæologists if they are allowed to continue in the Bloomsbury museum, which is so universal in its scope objects produced in any age or country do not appear to be out of place.

A LETTER has been written by Mr. W. EMERSON on the extreme danger from fire to which St. Paul's Cathedral is subjected in consequence of the wood stages with which it is now so completely shrouded. For its entire length the south side is encased in woodwork, very much of it being so slight in character that it would burn up with great rapidity. From the interior of the building it is seen that this woodwork is brought up close to the windows, which are obscured for nearly half their height. The tiers of seats are surmounted by canvas and tarpaulin. The woodwork slopes up from the street to the church walls, to which in many places it is actually attached. Fire would, of course, run with terrific rapidity up this slope and would expend much of its energy against the Cathedral walls. The result of the burning of these flimsy structures would calcine the limestone with which the walls are faced, and, giving rise to showers of sparks on a vast scale, might even attack the roofs. Attention was drawn some days back to a similar danger to the National Gallery, and an assurance was given that ample precautions have been taken. At Westminster the seats for the public are well detached from the walls of the Abbey. It is to be hoped that the City authorities are taking every precaution in the event of fire, by careful watching and proper provision of fire appliances.

THE publication of the "Building Trades' Directory" is always an event of importance to the numerous classes of business men who are represented by it. No other work so well reflects the great army of producers who are at the command of architects. To the compilers there is no distinction of degrees. A small town, if it should possess a builder, is equally recognised with the provincial cities or the Metropolis itself. All are treated in an exhaustive and accurate manner. The "Building Trades' Directory," like the others issued by the company, are triumphs of methodical inquiry. All the tests we have applied have been sustained by the pages, and as on former occasions we can again gladly testify to the care and impartiality shown throughout. It is no longer needful to say the book is indispensable to all who have dealings with any of the trades, for the Directory has long since established its utility. But there never was a time when it was more necessary to retain business in England, and in the efforts which will be required the Directory will be found a trustworthy auxiliary.

## FESTAL ART.

"THE Man in the Street" has of late taken the position of representative of English opinion. From his conversation about the decoration of London at the present time it becomes evident that what is popularly considered as the most successful structure which has been set up is the addition which is to serve as a vestibule to Westminster Abbey. It is believed to be so picturesque in itself and enhancing of the building, there has been a desire expressed for its retention. That, it must be owned, was prior to the detersive effect of the recent rain. After all the speeches and writings concerning art, the large sums which have been expended on teaching, the foundation and equipment of public galleries during half a century, the British mind is still in such a backward state it can put a sham on the same level as the glorious Abbey, and is likely to feel more regret on the removal of the lath-and-plaster structure than on any of the transformations which the Mediæval work has had to suffer.

If we walk through the principal streets of the Metropolis it will be found that what has given charm to the Westminster annexe is exhibited in many varieties. Every year we are growing more realistic, and in consequence we prize imitations in proportion to their fidelity. At the Abbey the skill with which a resemblance of the old masonry is produced excites wonder, and in the arches and the larger structures, as well as in the humblest ornaments, the general satisfaction is owing to the absence of novelty.

It was not unwarranted to expect that on such an occasion imagination and fancy would for once be allowed some liberty. For temporary decoration it is not necessary to adhere to stereotyped forms, as if the least departure from them involved appearance in a police court and the infliction of penalties by a magistrate. The present is a time when even the new art, with its extravagances, might be permitted to assert itself. But public opinion is adverse to everything which can be regarded as novel, and probably there never was a celebration when so much money was expended on the reproduction of traditional forms on a big and little scale. The Japanese manufacturers have been also pressed into service for the supply of coronation ornaments, but in endeavouring to satisfy British taste they have perpetrated much which must have excited the laughter of the dusky artists and vendors, for anything more hideous was never seen out of nightmares.

Excuses for the deficiencies of the objects which have been employed to demonstrate British loyalty are easily forthcoming. In the first place the decorations are not intended to have endurance, and the practical English nature is opposed to the dissolving of pearls in wine or the sacrifice of beautiful art to a temporary purpose. The ornamentation is only to be transient, an unsubstantial pageant which will leave not a rack behind. It must also be said that out-of-doors festivities are rare with us, and consequently we are not possessed of that mental organisation which can promptly turn an opportunity to account when one arises. Merry England was never remarkable for street decorations. When young and old came forth to play upon a sunshine holiday they did not seek for much external splendour,

And pomp, and feast, and revelry,  
With mask and antique pagentry,  
Such sights as youthful poets dream  
On summer eves by haunted stream,

were to be found within baronial halls rather than in LUD'S own town. When FROISSART said of the English, "ils se rejoissoient tristement, selon la coutume de leur pays," his judgment comprehended the street-scenes he witnessed when there were public celebrations.

There can be no question, however, that public rejoicings have long exercised a most beneficial influence on art. The highest art originated in them. The glorious frieze of the Parthenon, in which sculpture attained its culmination, is no more than a record in marble of a procession on a summer day in honour of ATHENÉ. The Greek artists were happy in being able to witness many other scenes which were equally inspiring. If LEIGHTON could make so admirable a picture from a description of the Daphnephoria, what must have been the effect when living youths selected

for their beauty passed before the eyes of a painter? There were several other processions no less attractive, such as the Brauronia, in which poets or rhapsodists, as well as girls in crocus-coloured garments shared—the Delia, the Dionysia, the Oschophoria or vintage festivals, and others. In them painters and sculptors could see the best proportioned forms to be found in a district, not posed like models, but in graceful action, and all having enjoyment in their participation. A Greek procession was not like one of ours, for, as the Daphnephoria picture suggests, there was a variety of ages in order to avoid monotony, and there were numerous small groups rather than one having the uniformity of drilled soldiers or of slaves kept together by authority.

In Italian cities the public festivals, although they may not have been equal in refinement to those in Greece at an earlier time, possessed a charm of their own. Let us cite one example. When LEO X. proposed to visit Florence the first step taken by the authorities was to invoke the aid of all the artists. Architects, painters and sculptors were enabled to co-operate; it was among their privileges. No less than twelve triumphal arches were erected. These were no mere copies in timber of Roman examples, but adorned with statues and paintings, and in effect probably surpassed ancient works. ANTONIO DA SANGALLO constructed an octagonal temple. JACOPO SANSOVINO exhibited his skill as a sculptor as well as an architect, and not only prepared bas-reliefs and figures for the temporary façade of the cathedral, but made an immense horse like one of the antique figures in Rome. ANDREA DEL SARTO painted the façade in his best style. BACCIO BANDINELLI modelled a statue of a giant. Obelisks, columns and groups of figures were executed, and as much as possible was accomplished to recall to the Pontiff renowned objects which were familiar to him in his capital. If we may judge from what is said by VASARI and other writers, the artists of Florence were expected to be ready to give their services for the decoration of the streets during festivals in honour of visitors, corporations or religious guilds. Their assistance appears to have been rendered without other payment than the satisfaction of serving the city by upholding its reputation for art, and there were so many willing hands the burden on an individual artist was not onerous. If we remember that each of the artists was surrounded by several assistants and apprentices, we can more easily realise how extended was the excitement which was caused by a public festival in Florence, and how young and old were eager to have the distinction of sharing in the preparations.

Indeed, the artists seem to have enjoyed themselves at their social meetings by strange exercises, which were possibly experiments or rehearsals of scenes which were to be displayed afterwards before the public. VASARI, in describing the company known as the "Caldron," to which ANDREA DEL SARTO, ARISTOTE DA SANGALLO, BACELLI, the musician, and other artists belonged, tells us that GIAN FRANCESCO RUSTICI one evening made an immense vessel in which the members were placed, and which, with the aid of various decorations, was intended to represent the legend of the boiling of JASON's father in order to rejuvenate him. In that case there were supposed to be several Argonauts. Such a scene, if exhibited in public, would have been an undoubted success, and it was appropriate for a body of Caldronites. The stories told of the strange creations by DA VINCI, the Medusa's head with the eyes flashing fire, the moving reptiles and animals, the Neptune with mermaids and tritons, all seemed to recall the spectacles that were witnessed in Florence and other Italian cities. The company bearing the title of the Trowel was remarkable for its *tableaux vivants*, which were based on mythological subjects. LORENZO DE MEDICI was a member of one of the companies, and he used all his diplomatic skill to have the spectacles of his fellow members more successful than those of their rivals. But all those animated scenes were presented with a background which, if inanimate, was also attractive. In fact, an Italian city in those times was like a great painting in which all parts of the composition helped in producing a general effect.

Similar scenes were enacted elsewhere. The Flemings had also their living pictures and temporary structures of fantastic architecture which served as backgrounds for

them. When RUBENS had acquired renown both as a diplomatist and as a painter the municipal authorities of Antwerp were not afraid to apply to him for schemes for the decoration of the streets when DON FERDINAND the Regent was about to visit the city. The great artist had ceased to paint, but he complied with the request; the engravings of the triumphal arches which he designed are known to amateurs. He was only continuing a tradition which was general on the Continent, that great artists should assist in the public manifestations of art, for without such displays it was believed impossible for art to thrive.

INIGO JONES was a contemporary of RUBENS, and surpassed the Flemish painter in aptitude for arranging spectacles. BEN JONSON might sneer at the architect's ability to reveal mythology by paintings on slit deal, making boards speak, and treating painting and carpentry as the soul of masque. But the bricklayer poet's descriptions, in spite of his prejudice, are evidence of the marvellous ingenuity of INIGO JONES's scenic arrangements, and WALPOLE was justified in saying that the festivals of LOUIS XIV. were copied from the shows of Whitehall. It is remarkable that the architect's skill was never utilised for a spectacle outside the Court circle.

In many ways we still differ from foreigners, as in the days of INIGO JONES, and one of them is the scepticism that an artist can be helpful in the decoration of a street. It is considered that the manufacturers can be trusted to produce the most satisfactory results. There are many artists in London who would not have hesitated to prepare elaborate designs free of cost if their skill had been invoked in a proper manner. But the offers which were made were received so coldly there was no encouragement or anyone who valued his own dignity to design or advise. The decoration consequently, if regarded as a whole, will be more suggestive of the factory than of the studio, and it will reveal the shortcomings of the applied art of England. If the love of the beautiful is to be judged by the aspect of the streets, we are afraid the foreign visitors will be astonished at our claims to be proficient in the arts. There can be no doubt about the expenditure exceeding the amount which would be needed to produce a more tasteful arrangement, but that is a common experience in this country. As in other instances, the will must be taken for the deed, and the outlay will have to be accepted as an equivalent for the absence of good taste and invention. "Never anything can be amiss when simpleness and duty tender it," says SHAKESPEARE, and that principle requires to be often adopted when judging of public efforts in England, and it may be in matters of more consequence than Coronation decorations. At the same time it is to be regretted that decoration will be confounded in the public mind with the jost of crude colours and graceless forms which the streets of London are about to present.

#### REGISTRATION OF BUILDING SITES.

FROM time to time there are trials in the criminal courts relating to the obtaining of money by false pretences through fictitious mortgages. In one of the latest, two properties were fraudulently mortgaged no less than seventeen times. In another case the property was mortgaged twelve times. It is also known that a sum of over 50,000*l.* was given in a third case on the supposition that the deeds were genuine. Surveyors with any experience are rarely surprised when they hear of those transactions. And property sometimes rests on so uncertain a basis in England, it is a simple matter for unscrupulous people to become acquainted with the circumstances in particular instances and to raise money on, as it were, the doubtfulness of the ownership.

The temptation to dishonesty which arises from the hesitation of Government to interfere with private affairs is a new one. Political economists have descanted at length upon the indefinite nature of ownership, which made the buying and selling of land one of the costliest and most hazardous of businesses, but amendment was impossible owing to the opposition which was aroused among lawyers. The investigation of title was among the slowest of legal operations, and it was paid for accordingly. Not until a

daring lawyer arose like the first Lord WESTBURY, who was rather pleased to have enemies against him and to be charged with disloyalty to his profession, was there a chance of reform. After a long struggle he was able to pass an Act for the registration of title, but as it could only be optional in its provisions, its efficacy was exceedingly restricted. Few and far apart were the entries. Various endeavours were afterwards made to institute a thoroughly workable system of registration, but in vain. It is still feasible, as recent convictions testify, to raise repeated mortgages without a jot of a title to the property, and yet by a very simple system all dangers of that kind could be avoided.

We do not hear on the Continent that rogues, although they may abound there, find it easy to forge imitations of conveyances or to invent them, and by that means to obtain money seventeen times over on a small estate. There is security against such criminal practices through an official registration. The State maps show the limits of all property in land, no matter how small may be the area. Every change of ownership, every financial transaction connected with the properties must be recorded in order to acquire legality for them. A man who is invited to advance money on a mortgage can with no trouble or loss of time discover the position of the applicant, and ascertain whether a piece of ground or a house can be burdened with an additional mortgage without excessive risk. In foreign countries the sovereign was never supposed to refrain from controlling private property, and hence there is more simplicity about the titles than with us. In England also the theory is believed in that all the land is the possession of the monarch, but there has been so little meddling with property for centuries that private ownership is in practice accepted as unfettered. But in a great number of cases it would be impossible to produce documentary evidence sufficient to uphold the proprietorship. It is well known that in Ireland property has been sold under the Encumbered Estates Act, and all the expenses paid, in order to acquire a title from the Commissioners which could not be easily questioned in a court of law. In England a similar opportunity, if offered, would be eagerly utilised.

Owing to the uncertain state of many titles the Land Transfer Act has allowed a division of them into Absolute and Possessory. To determine the former it would be necessary to have an official examination of title. But the Legislature has hesitated about making that work obligatory. A Possessory title, on the other hand, does not demand much examination, and it may grow, if unquestioned, into an Absolute title. For all purposes of sale, possession during sixty years is as valid as possession during six centuries. It would be as onerous a task to disturb possession in one case as in the other. The doubts that so many people entertain about their titles, because they cannot claim to represent a long line of ancestors who lived on the same property and enjoyed all its rights uninterruptedly, should not deter them from taking advantage of registration under the Land Transfer Act, which facilitates dealings in land and increases the value of property to some extent.

The metropolitan area, from the vast number of the properties, is the principal scene of the discreditable transactions which have their origin in the mystery attending land. It is, therefore, interesting to review the efforts which have been made during the last three years to institute a general registry of title for the County of London. An experiment of the kind must have influence upon the future as well as the present, and Mr. C. FORTESCUE-BRICKDALE, the registrar, who conducted it, was anxious that there should be no failure. It is no small matter to endeavour to establish in an ancient and crowded district the procedure which is readily adopted in new countries like the British colonies. The Order of Council was dated July 18, 1898. At first it was intended to be applied to only a small part of the county, but gradually the whole metropolitan area on both sides of the Thames, with the exception of the City, has been enabled to have the benefit, if desired, of the Land Transfer Act.

The importance of the Order, if judged only in a business sense, will be understood when it is said that "in the course of three years 32,268 separate properties, of an

aggregate value of 34,907,643 $\frac{1}{2}$ l., have been placed on the register, and 21,875 transactions by sale, mortgage, inheritance and otherwise have also been recorded of these properties subsequently to their entry on the register, making a total of 54,143 applications dealt with." Every property registered requires the perusal of at least one deed, besides a great deal of recording, examination and mapping. It is needless to say that the properties present a remarkable diversity of character. Among them we are told are "buildings of every kind and value, from first-class residential houses and gardens in the west end to the poorest tenement dwellings in the east; from houses of business in the central thoroughfares, which have been standing for centuries, and where ground is sold and measured by the inch, to farms, orchards and agricultural holdings in distant suburbs, and building estates, with roads barely marked and plots unfenced, in the first stages of their development. There are registered chapels, schools, theatres, hotels, factories, flats, cellars, single floors, parts of rooms, archways, courts, passages, party walls, docks, wharves, parks, burial-grounds, railways, streets, tunnels, underground passages, rights of way, rights to light and air, to lateral support, to obstruct light and air, to build, to embank, to use gardens; settled land, tenancies in common, joint ownerships; freeholds, leaseholds and sub-leaseholds of every degree of complexity, including cases where the tenures are so intermixed as to be indistinguishable." Although the work was only experimental and 54,143 applications were dealt with, there was only one appeal to the Court, and in it the registrar's decision was affirmed.

As yet the work has to be got through in temporary premises, but a new building in the Tudor style is about to be erected for the Land Registry at the south-east corner of Lincoln's Inn Fields. In spite of the inconvenience of deficient accommodation the business has been transacted without loss of time to the public, for about 38 per cent. of the applications, it appears, were dealt with in less than a week, and only one attendance on the part of the landowner or his solicitor was required. It augurs well for the future, and reveals a great change among lawyers when it is acknowledged that the success of the department is in some measure due to the assistance given by members of the legal profession. The advantages of registration are therefore becoming manifest, and efforts are made to promote its successful development.

The staff appointed consists of the registrar; two assistant registrars, one a barrister, the other a solicitor; two first-class clerks, seven second-class and sixteen third-class clerks. For the mapping and surveying work there are two chief superintendents, ten examiners and superintendents, twenty-four surveyors and thirty-five assistant draughtsmen, besides supernumeraries and boys. There is also a scrivener department. As usual the technical department is paid at a lower rate than the administrative. Apart from the registrar, his assistants and clerks number thirty-one, and they are paid 7,415 $\frac{1}{2}$ l., or an average of 240 $\frac{1}{2}$ l. a year. In the map department there are 104 employés, who are paid 10,200 $\frac{1}{2}$ l., or an average of about 100 $\frac{1}{2}$ l. a year. By another return the number is put down as 102, and the salaries at 14,887 $\frac{1}{2}$ l. It is not surprising to learn that it is difficult to obtain suitable surveyors, revisers and draughtsmen. The last are chiefly of the architects' assistant class.

The register consists of three parts, viz. the property register or description; the proprietorship register and the charges register recording the charges, leases and other encumbrances. The entries are based on the last conveyance of sale, or on the lease. There is also an ordnance plan of the property. In the case of transfers or charges there are new entries, and if only a portion of the estate is dealt with, the limits are marked on the original plan and a new plan is made. Whenever there is a change of ownership it is stated on the land certificate obtained by the leaseholder, as well as on the register. The official work, as we have said, usually occupies not more than a week. About 90 per cent. of those cases which take more time are delayed through some serious discrepancy between the description in the applicant's deed and the state of the property as marked on the revised ordnance map. On another page we have copied some examples of the

discrepancies, and they suggest that similar plans afford opportunities for law suits at a future time.

There was a time when doubts were expressed about the value of the Ordnance Survey as a legal document, and it was said the sheets could not be accepted in law courts. The reason given was the impossibility of finding a witness that could testify to the accuracy of the maps. A less rigid rule now prevails. The maps were used for the surveys for the Encumbered Estates Act and the Landlord's Estates Act of Ireland. They are also recognised by the Land Transfer Acts. The Ordnance Survey in the county of London is not up to date, and to make it useful for the registry, revision in almost every case is indispensable.

An applicant for registration in the first instance points out the property with which he is dealing; but it has been found that all applicants are not competent to read maps, and many cases of wrong identification have occurred. If the property is correctly shown on the published Ordnance Survey plan, and agrees with the description in the legal documents, all that is required is to cut out the part from three plans, to mark the boundaries with a band of colour and to inscribe the heading and number. One copy is filed in the registry, a second is bound up with the land certificate and given to the proprietor, and a third copy is placed in a strong-room for reference in case the filed copy is lost or destroyed. Where the descriptions and plans do not agree, revision on the ground is indispensable. Lithographic plans which are produced at a very cheap rate are now used to supplement the Ordnance Survey.

Already the system of registration has accomplished beneficial effects. In the course of the three years several successive dealings have occurred with various pieces of land which are on the register. Under the ordinary system a great many deeds would have to be prepared, with a proportionate expense, whilst at the Land Registry Office only a few short entries are needed. The more deeds that are prepared the greater is the liability to error, but errors may be considered as avoidable in the books of the department.

The system cannot be complete until absolute titles are also registered. It is assumed by some owners that technical flaws will be discovered by the department, and that registration would be refused. Hitherto the only cases in which there was refusal were those "in which the owners were aware that they would have trouble if they attempted to sell in the ordinary way, and hoped that the Land Registry might be able in some manner to cure the mischief. This, it need hardly be said, is not the purpose for which the Land Registry is intended. It is not a hospital for weak titles. It is rather an assay office, where an ordinary title may be, as it were, hall-marked by public authority, so as to prevent the necessity for repeated private tests on successive future dealings. The standard adopted so far has been neither above nor below that which is found to be sufficient for practical safety on ordinary sales and mortgages of the various classes of property coming under review."

It sometimes happens that people who contemplate the erection of new buildings draw back on account of their misgivings about the soundness of the title to the sites. Many cases are known in which money was lost and much trouble given by defects which the lawyers had overlooked. It is often said that a leasehold is therefore safer than a freehold. It becomes the interest of architects to aid in supporting a system which will help to diminish the inconvenience which is possible whenever land is not treated like commodities in general, and intending purchasers are prohibited from investigating the power to sell. If the system of registration had been insisted on thirty years ago, there would be now a great many apprehensions removed which disturb the minds of purchasers of land, and have arisen within that period. Late as is the time for the enactment, the benefits to be derived from registration are not easily estimated.

The Ecclesiastical Commissioners have not made arrangements for the sale of Hartlebury Castle. They are willing, however, provided a suitable residence can be obtained or means can be found for erecting such a residence, to approve of the sale of the Castle.

## WESTMINSTER ABBEY AND ITS RESTORATIONS.

MEETING of the Society for the Protection of Ancient Buildings was held on the 11th inst.

Lord Balcarras, M.P., who presided, moved the adoption of the annual report, and said it showed that in many cases the Society took credit to itself for having done useful work, though there were buildings of extreme interest and beauty which had been lost owing to the fact that the principles of the Society were not so widely accepted as they could desire. During the twelve months their income was only a trifle over 300*l*, and that was a very small sum for a Society which did so considerable amount of work. With a larger number of members it would be possible for them to deal with a still larger number of buildings. He pleaded, on behalf of the building fund, that persons who gave subscriptions for the building, repair or restoration of ancient buildings should do so through the Society, as by that means there would be a guarantee of the money's being judiciously laid out, while there would be a corresponding improvement to the position and influence of the Society.

Miss Morris seconded the motion for the adoption of the report, and this was agreed to.

Professor Lethaby read a paper on "Westminster Abbey and its Restorations." Referring to the preparations made for the Coronation of Edward I., he said the accounts still in existence showed that a great stable was built in St. Margaret's Churchyard, temporary halls were set up in the gardens of the Palace for the people to feast in, a wooden passage was built from the Palace to the church, and, most interesting entry of which we were told that the new tower above the choir was covered with boards, and a wooden floor was laid down in the choir, showing both that the works in this part of the church were not yet complete, and, what had been a much controverted point, that a central lantern tower was contemplated in the original scheme. Henry III.'s work was followed by violent destructions, and by the more insidious form of destruction still going on under the name of restoration—false in name as in fact. He traced the story of these destructions from the date in question, and, coming to modern times, said that the first third of the nineteenth century seemed to have been devoted to the destruction of the Palace buildings, the Painted Chamber, St. Stephen's Chapel and the Star Chamber. Westminster Hall was renewed with inanity, and Henry VII.'s chapel was entirely recased. Westminster Gate, towards Hill Street, and other precious buildings in Dean's Yard were destroyed. Then came the age of Blore, Scott and Pearson. Blore stuck at the lovely early fourteenth-century bays of the cloister and put new in their place, and gave the north front of the nave another dressing. Scott completed the renewal of the cloister, and reared the south transept and set up the chapter-house again. Mr. Pearson did not like Wren's work at the north transept, and felt called on to re-edit it into its present form. At the present similar corrections were going forward at the west front, and in the present year the south rose window, renewed less than a century ago, had been cut out and redone once more. They began with new glass, but on the principle that it was best to do work thoroughly, stone and all had gone. He would suggest to them how different it would have been with Westminster if, instead of learning, theory, and caprice, they had put this energy in pulling down and setting up, there had been steadily carried on during the last century a system of patching, staying and repairs—a sort of building dentistry. Even if they could arrest the process of so-called improvement which was slowly creeping over the whole building in a sort of daily paralysis, and substitute mere daily carefulness, much might be handed on for another age.

Mr. Somers Clarke, in proposing a vote of thanks to Professor Lethaby, said that in connection with the Coronation the most wonderful efforts were now being made to save the fabric of the structure. These efforts, he thought, were mainly the outcome of the action which had been taken in the matter by their Society.

The vote of thanks was passed.

## ST. MICHAEL'S, LINLITHGOW.

WE lately described the proposed project of restoration of St. Michael's Church, Linlithgow, in which stone vaulting over the nave was contemplated. At the last meeting of the standing committee of the heritors of the parish of Linlithgow and the church committee of the Town Council a communication from Mr. William George Black, secretary to the council of the Archaeological Society, to the following effect was read:—"By instructions of the council of the Archaeological Society, I beg to send you the annexed excerpt from the minutes of their meeting on May 16, which it is hoped on a favorable opportunity you may bring under the notice of the heritors of the parish of Linlithgow." The excerpt referred to

was in the following terms:—"A letter was read from Mr. Peter Miller, solicitor, Linlithgow, enclosing a report by Messrs. John Gordon & D. Bennett Dobson, architects, Glasgow, recommending certain proposed alterations and restorations on the tower of St. Michael's Abbey Church, Linlithgow. After careful consideration of the papers submitted, it was resolved, on the motion of the Very Rev. Principal Story, seconded by Mr. J. D. G. Dalrymple, hon. secretary, That the Council strongly deprecate the proposal to erect a stone roof on the nave of St. Michael's Abbey Church, Linlithgow (which it never had), and the restoration in the manner proposed of the crown on the tower if it necessitates the reconstruction of any portion of the tower. The secretaries were instructed to send a copy of this resolution to Mr. Peter Miller, solicitor, Linlithgow, and to the clerk to the heritors of Linlithgow and the secretary of the Society of Antiquaries of Scotland." The Clerk also submitted a letter of May 23 which he had also received on the subject from the secretary (Mr. Thackeray Turner) to the Society for the Protection of Ancient Buildings, to the following effect:—"The Society for the Protection of Ancient Buildings has been deeply interested in the proposals for dealing with the structural condition of St. Michael's Church, Linlithgow, and proposed attempts to improve the building, as stated in the architect's report published in the *Scotsman* of April 26. The committee of the Society feels so strongly opposed to some of the proposals that it has decided, after careful consideration, upon venturing to address the heritors upon the subject. The Society would in no way wish to thwart the praiseworthy desire of those who are anxious that this magnificent building should be preserved; but at the same time it cannot consider that the erection of flying buttresses and stone vaulting over the nave can be justified on this or any other grounds, and although it is fully aware that some hundred years ago the tower possessed a characteristic stone crown, which was taken down for structural reasons, it nevertheless thinks that its re-erection could not be justified if it had to be made anew, conjecturally; for drawings and even photographs of the original would not enable an architect to reproduce the original in all its details, even if it were desirable to do so. Of course if, unknown to the Society, the original stones are in existence, the case would be different, but at the present time the public opinion of those who have paid attention to the subject is fairly unanimous in considering that reproductions of ancient work, even when they are known to be accurate copies, are dull, lifeless and consequently undesirable. Holding these opinions, the Society trusts that the heritors will consider it is justified in opposing the architect's scheme, and in urging the heritors to withhold their approval to any unnecessary alteration of the building, and to insist that all works shall be confined to structural repair, such, for instance, as those of which, we gather, the tower is in real need." The Clerk reported that he had acknowledged receipt of the communications to the senders, and the meeting directed that they "lie on the table."

## INACCURATE PLANS IN DEEDS.

THE Registrar of the Land Registry has rendered a service to owners of property and others by calling attention to the inaccurate plans which are supposed to be exact representations of the ground on which buildings are erected. The subject has been treated occasionally in *The Architect*, and we have pointed out to lawyers how much inconvenience they were creating for their clients by allowing plans on conveyances to be drawn in the offices of law-writers and the back rooms of stationers' shops by men and women who could have no knowledge of surveying, and were indifferent to north, south, east and west when arranging a plot of land on parchment or paper. We reproduce some of the specimens which were lodged in the Land Registry Office and a comparison of them with the corrected Ordnance plans, and the descriptions will suggest how easily law suits can originate in the defects of plans which have without doubt cost as much as if they were prepared by competent surveyors.

*Example 1.—Deed conveying more than was intended.*

The verbal description was a typical example of its class; it ran as follows:—

"All that piece or parcel of land situate in the parish of in the county of London bounded on the North partly by land formerly belonging to A and partly by stables and premises formerly belonging to B (all which land stable and premises afterwards belonged to the said C) on the south by a dwelling house now or late belonging to the said B and known as No. 3 [really 117] Z Street on the East by the road called Z Street running from a road formerly called Y Lane but now and for some time past called V Hill

and on the West by land now or late belonging to the said A which said piece or parcel of land contains on the East side or front thereof next the said road called Z Street forty [really thirty] feet on the South side thereof one hundred and eighty-two feet on the West side or rear thereof forty-three [really twenty-two] feet and on the North side thereof one hundred and eighty-five feet be the several dimensions little more or less and also all that messuage or tenement or dwelling-house erected and built on the said piece of land or part thereof known as No. 4 [really No. 115] Z Street otherwise M House together with the appurtenances (which said premises are more particularly delineated in the plan drawn in the margin of these presents and thereon coloured red and green)."

The crossed portions of these two plans represent—on the right, the ordnance map of the land intended to be conveyed; on the left, the plan on the deed, reduced to the ordnance scale—names being omitted.

The impossibility of applying this description and plan (which had evidently been copied with insufficient corrections from some former deed) to the actual state of things on the ground as shown by the ordnance map led to further inquiry, which resulted in the applicant being registered as proprietor of the smaller amount shown in the right-hand plan, which was all he had intended to buy.

#### Examples 2, 3, 4.—Deeds conveying less than was intended.

In the last case the verbal description was long and elaborate, though the state of the property boundaries was simple and clear. In this case the verbal description was concise in the extreme, but the property boundaries were most elaborate, including large cellars under and a staircase and lobby in an adjoining house, and excluding the attics in the house conveyed—the whole spread over an area almost double the extent of the land shown on the deed plan. Of these matters the deed contained not the slightest indication in any part. The words used were as follows:—

"All that piece or parcel of ground situate on the east side of Street in the parish of in the county of London together with the beerhouse erected thereon and known as the and numbered Street aforesaid all which premises are more particularly delineated and coloured red on the plan drawn in the margin of these presents."

The plan was as shown in the left-hand plan below. As this did not appear to fit the ordnance map very well the ground was visited, the facts ascertained and a correct plan and description were made. The registered plan showed by different tints the various portions of the property held on different floors, as shown in the right-hand plan below, the thick black representing the red boundary line and the different shadings the different tints used. The left-hand plan is reduced to the ordnance scale.

#### 3. In one case the words were as follows:—

"All that freehold piece of land adjoining No. 1 Street aforesaid which with the boundaries abutments and dimensions thereof is more particularly delineated and described on the said plan annexed hereto and therein coloured blue."

The plan was coloured like this:—

The blue colour only extended to the shaded part in above plan, but the parts marked "sheds" were intended to be conveyed as well.

4. In another case (a lease) the plan on the deed and land intended to be leased were respectively as follows:—

Example 5.—Deed conveying land not intended, and omitted land intended to be conveyed.

In this case the deed (as will be seen from the plans) conveyed land not intended to be conveyed, and omitted a portion intended to be conveyed. The words used were:—

"All that piece or parcel of land situate in the parish of in the county of Kent [really the county of London] and having a frontage to the Road of 16 feet 1½ inches as the same is more particularly delineated and described in the plan drawn in the margin of these presents and thereon coloured pink together with the messuage or tenement erected thereon and known as 118 Road aforesaid."

The left-hand plan below is a copy of the plan on the deed. The right-hand plan the shaded portion shows the correct position and position of the house, the dotted line at the back shows the land contained in the deed plan according to the dimensions written on it, the continuous lines represent the messuages erected and intended to be conveyed.

*Note as to Examples 2 to 5.*

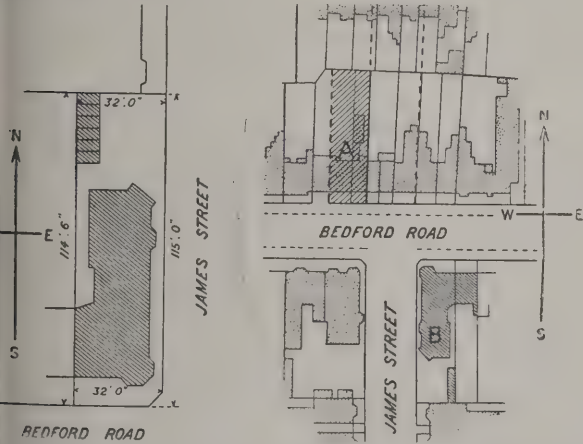

When they were compared with the revised ordnance map the insufficiency of the conveyances became apparent, but their defects had escaped observation until the land registry surveyors pointed them out. The deeds in all these instances except two, where the words seemed just capable of applying to a larger area if necessary) were corrected and re-executed. If this not been done the errors would have remained until discovered perhaps by some future purchaser, more careful than his predecessors, who, if well advised, would have refused to complete until the defects were made good, an operation which after the lapse of years would prove much more expensive and difficult to accomplish than now while the parties are still in communication.

*Example 6.—Land described and identified, forming no part of the land intended to be conveyed.*

In this case the verbal description in the deed (with different names) ran as follows:—

"All that piece of land situate lying and being on the North side of Bedford Road and on the West side of James Street and being at the junction of such road and street in the parish of in the county of Surrey [really the county of London] together with the two Block residential Flats known as House erected and built thereon or on some part thereof as the same premises are delineated and coloured red in the plan drawn in the margin hereof."

The plan on the deed agreed with the verbal description. The left-hand plan below is a copy of it, the street names being correspondingly altered.

When laid down on the ordnance map (shown in the right-hand plan above) it occupied the position shown by the cross-hatched portion marked A. Being asked to explain the discrepancy of internal detail, the applicant stated that the existing houses were to be pulled down and that James Street was to be extended northward as indicated. The registry surveyors were not quite satisfied and made further inquiry, when it appeared that the original plan had been made by mistake upside down, that the verbal description had been proposed from it, and that the conveyance was intended to refer to the house at the opposite corner (shown also on the left-hand plan and marked B), the ground plan of which will be found to agree, when inverted, with that of the house shown in the right-hand plan.

The Campanile of the new Roman Catholic cathedral at Exeter will be illuminated with electric light on the evenings of the 26th and 27th inst. Among the devices employed will be a powerful searchlight to be worked from a building 282 feet from the ground. There will also be two enormous crowns containing some hundreds of electric lights.

PALESTINE EXPLORATION FUND.

ON Tuesday an address was given at the annual general meeting by Major-General Sir Charles Wilson, R.E., F.R.S., on "The Recent and Proposed Excavations of the Fund." The chair was taken by Lord Eustace Cecil, and there was a large attendance. The report, read by the Secretary, stated that the receipts exceeded 1,900*l*, and expressed regret at the losses sustained in the deaths of Lord Dufferin, Bishop Westcott, Sir Richard Temple, Mr. T. Rymer and Dr. Conrad Schlick. It was a source of gratification that Dr. Glaisher, though in his ninety-fourth year, maintained unabated his zeal and labours for the fund.

The Chairman, after brief reference to the annual losses, mentioned the main discoveries of the year, of which the principal was that of the ruins of Gezer. The thanks of the fund were due to Mr. Stewart Macalister, Dr. Masterman and other labourers for the fund. It was, however, a serious matter for regret that the ancient remains were so greatly injured by the natives and others. Much of the success of the Society was due to the co-operation of the United States, and gratitude was especially due to Dr. Theodore Wright. He moved the adoption of the report.

The motion was seconded by the Rev. Dr. Rogers, who urged the speedy prosecution of the work, in view of the devastating influences at work and the frequent incursions of robbers.

The report was carried.

Sir Charles Wilson said that the work of the last year had been mainly the excavation of mounds in the valley of Judah, and they had thrown light on many ancient sites. The excavations revealed remains of pre-Israelitish times from 1700 B.C. and the successive periods down to Byzantine times. Painted ware and Mycenaean pottery were found in this region, and specimens of early Greek ware as well as Assyrian and Babylonian objects. The site was probably to be identified with that of Gath. Remains were also found of a town abandoned in pre-Israelite times, and there relics of subsequent periods were also discovered. Statues were found of Demeter and Berenice, and also pottery and other fragments of the third and fourth century B.C. imported into Palestine. Two inscriptions in Greek characters were discovered, and one of them was divided into seven columns, and there was a curious translation from Hebrew to Greek, the Greek characters being read from right to left. There were many tablets commemorative of important events, such as birth or marriage; and there were symbolical references—e.g. a white stone was taken to represent him that overcometh. In these remains instructive sidelights were thrown on the social life of the people living at various times in Palestine. Mr. Macalister had done most valuable work, and his conclusion was that few of the caves he examined were earlier than the Seleucid period. Some of the caves contained, it would seem, remains of an aboriginal or, perhaps, a composite population distinct from that of the towns. The pottery began with the pre-Israelite or Amorite period—earlier than the Mycenaean times. They were similar to specimens discovered by Professor Flinders Petrie in Egypt. Specimens of the earliest work were shown on the screen. Among this very early pottery no lamp had been discovered. The painted pottery or sherds presented Mycenaean features, though probably not Mycenaean work. In the Jewish period the Mycenaean and Phoenician influences seemed to have disappeared. The names of the potters—always of a tribal character—were found on many specimens of the Jewish pottery; among them were the two-winged scarabæus and birds. After the Jewish period there was a distinct growth of beauty in form and design. In these later times there were few completed statues, but some of these were of fine workmanship and form. A number of dolls of various shapes and bound in very singular manner that had been discovered by Mr. Macalister were shown on the screen. One of the great caves was used as a columbarium after its original purpose had been abandoned. As to the future programme of the fund, it was proposed to work on the littoral of the Dead Sea, and it was intended to take accurate meteorological records of the Jordan Valley. It was supposed that the former rise of levels had been followed by a fall. Careful observations would be taken at Jericho and other points. Mr. Macalister, however, proposed particularly to devote himself to Gezer, where valuable historical material might be discovered. There was much to do, and great results might be expected; but funds were needed. The German and Austrian explorations had been well supported and brought interesting remains to light, and it was to be hoped that the British fund would not fall behind. The address concluded with illustrations and explanations of the ancient and modern water-supply of Jerusalem.

A vote of thanks was heartily passed to Sir Charles Wilson.

The Earl of Idlesleigh will preside at the annual congress in connection with the Royal Institute of Public Health which will be held in Exeter from August 21 to 26.

## NOTES AND COMMENTS.

THE Corporation of Westminster appear to have been inspired by the spirit which in days before municipal reform was known used to animate such bodies, when they set up the stands near the Law Courts for spectators of the Coronation procession. At such a time the utmost facility should be allowed to the great mass of the public who have no friends in a Corporation and cannot afford to pay for seats. The stand, however, has encroached on the pavement to such an extent as almost to prevent traffic. In a legal sense the Westminster Corporation have a right to the pavements in all the streets of their city. It is not good sense or good taste to monopolise so important a spot. The blocking of the pavement is so reprehensible, Mr. Justice GRANTHAM, who has the control of the stands which have been erected for the use of the judges and the Bar, would not allow any encroachment on the footway, and on Monday, in his Court, he stated the facts, in order that no opprobrium might in the public mind be attached to the Lord Chancellor and the judges.

It would be difficult to discover a work of the class which will bear comparison with the large volume containing illustrations of buildings in which Burmantofts faience, vitreous glazed terra-cotta and glazed bricks have been employed. From its execution it is so beautiful as to be elevated out of the category of ordinary industrial publications. There are about fifty plates of buildings, all of which have interest as architects' works, but what must strike every one who glances at the collection is the adaptability of the Burmantofts specialties to the most varied styles of architecture. The Technical College, Darlington, is in rather severe Gothic, but the peculiarities of the style are admirably expressed in every part. The mouldings are as true in their way as the ornamental panels or the large floriated finials. On the other hand, the interiors of the Queen's Hotel, Leeds, which are adorned in ivory and gold faience, are as delicate and boudoirish in character as the finest French carving. The work in the latter building is, from its finesse and charm, sufficient to indicate the progress made in our time in manipulating clay. The panels would at first sight appear to be refined repoussé-work in metal rather than faience. But evidently the distinction between architectural work and advanced ceramics is being diminished, and in this hotel the ceiling will rival any vases which can be placed in the rooms. The figure-painting in the panels has also the true decorative character. In a Leicester church we see Romanesque, in which archaic severity is softened by the capitals of columns with cherubs' heads as elements, and the winged figures of various sizes which are introduced in the chancel screen, the pulpit and elsewhere. Terra-cotta figures are liberally used in the exterior of the news room at Leicester, and with the abundance of columns give a unique effect to the building. In Lloyds Bank, Leeds, and the National Provincial Bank, Manchester, Mr. WATERHOUSE, who has had so much influence in the utilisation of terra-cotta, has encased the columns and veiled the walls with Burmantofts materials. The advantage of the faience has been recognised frankly, and scope is allowed for the display of its properties by contrasting colours. In the Hotel Great Central, London, it is employed as a wall-lining and for the decoration on a grandiose scale of the courtyard. In the Turkish baths at Blackpool the faience is recognised as peculiarly suited for walls, doors and ceilings, for there is not only Eastern richness of effect, but the surety of cleanliness. The surfaces are impervious, and can be cleansed expeditiously. Indeed the sanitary advantages of the material are among its recommendations, and they impart a new interest to the beauty of form and colour in the decoration. Another benefit is the economy of this variety of plastic art. It will be observed by comparing the warehouse in Leicester with those which hitherto have been raised in Manchester and other provincial towns. In Messrs. FAIRE'S building there is no excess of decoration, and the structure at once suggests its purpose. But the well-balanced ornament is so skilfully introduced it seems to be a necessity, and it is found in places where it cannot be injured. In the Alhambra Theatre, Blackpool, the reliefs are also in the right positions, but in this example the need of big announcements of entertainments diminishes

the effect; the modelling of the figures is throughout artistic. In the London offices of the Commercial Union Insurance Company the ceilings are of faience, and show refined ornament in the Italian style. Photography cannot deceive, and the detail seen in the plates will sustain scrutiny with a magnifying glass. It would be erroneous to conclude that the specialties are destined for decorative work alone. Victoria Station, Nottingham, proves that the Burmantofts glazed brick and vitreous glazed terra-cotta can be used with success for engineering structures, and there are several exteriors which testify that the materials are universally applicable in construction. The volume is the most creditable record of honest work which can be desired, and we might say the most persuasive. In it we see how successfully strength and beauty can be combined, and how remarkable is the progress which has been accomplished in the great Burmantofts Works through the union of artistic power, business management and commercial enterprise.

THE London County Council have adopted measures which will diminish the risk of any fire which may arise during the Coronation festivities. Firemen with portable telephones will be stationed at the fire alarms on or near the route to be traversed by their Majesties, and firemen will also be stationed to point out the positions of fire hydrants along the line. Arrangements will be made for the attendance of engines to interfere as little as possible with the general plan. It is proposed to carry out on June 27 arrangements similar to those adopted on the occasion of Queen VICTORIA'S Diamond Jubilee procession, and which were found most satisfactory. Four horsed escapes and seven steam fire-engines will be placed at convenient points on the route for attending fires in the thoroughfares through which the procession will pass, and arrangements will be made for the attendance of engines generally without crossing that line. The other precautions arranged for June 26 will hold good for the following day also. All leave for firemen will be stopped until the end of June. Authority has been also given for hiring additional horses. The stands near the Abbey have been inspected by the chief officer. It was intimated, however, to the First Commissioner that the services rendered were performed on the distinct understanding that neither the Council nor the Fire Brigade undertake any responsibility in the matter.

"LE BON ROI DAGOBERT" with his Prime Minister St. ELOI, the goldsmith, are to the majority of Frenchmen only mythical personages. So many amusing songs have been made about them, they will not be easily forgotten. A chair which is in the Bibliothèque Nationale is stated to have been executed by the saint, and it has some characteristics from which it may be concluded to be a work of the seventh century. There seems to be little doubt that in any case it is older than the Coronation chair at Westminster, but it has not been used at many functions. One reason was that during a great many centuries the ceremony of Coronation was performed at Rheims, where the chair was not kept. It has often been represented in archaeological books, and is now found in the Cabinet des Médailles of the library.

DESIGN FOR PANEL IN CARRIAGE, SOUTH AFRICAN RAILWAY.  
DESIGN FOR INLAY.

ONE of the designs we publish this week was prepared by Mr. STEPHEN WEBB as a part of a scheme of decoration in connection with the South African Railway. The second is from a working drawing for an inlay of various woods, some of them stained, and mother of pearl. Mr. WEBB has made the engraving, and the inlay has been considered very successful.

PORTION OF THE NORTH SIDE OF NAVE.

## HORSHAM.\*

THE fine old town we have seen to-day is a borough and parish in the Hundred of Singlecross and the Rape of Bramber. (Parenthetically, I may here mention that Rape, as a county division, is peculiar to Sussex, the county being split up into six of these. The word is supposed to be identical with the hreppr; or rope, of Iceland. It was the custom of the Teutons to set out land by the aid of a rope—as modern surveyors use the chain—and the six Rapes of Sussex were divided due north and south, each containing its castle, its river and its forest.) By some authorities Horsham is said to have derived its name from Horsa, or Horse's Meadow, but the commonly-accepted interpretation of the name is that it was from Horsa, a brother of Hengist, who is said to have founded it. The first syllable, however, was common to both Angles and Saxons, while the second (Hām, meadow) supplies unquestionable proof of its Saxon antiquity. Although only meagre records of the early history of Horsham are available, here is very little, if any, doubt that with forty-one other manors in Sussex it was given by William the Conqueror to William de Braose, who landed in this country with him in 1066, and continued in the hands of that well-known family until, in 1298, Olivia, co-heiress of William de Braose, the seventh in descent from his ancestor bearing that name, carried it by marriage to John de Mowbray, the lord of Axholme, whose descendant, Thomas, was created Duke of Norfolk in 1391. De Mowbray's granddaughter, Margaret, married Sir Robert Howard, and their son John, a Knight of the Garter, was by Richard III., in 1483, made Duke of Norfolk. From him the estates, which included the lordship of Horsham, have descended—except for several attainders which were afterwards reversed—to the present duke of that name. Probably the arms of Horsham owe their derivation to the De Braoses, which were azure crucially of crosslets, a lion crowned all or; in the Horsham borough arms, however, the crosslets are missing, the lion is in argent, and is resting his dexter paw on an antique H.

In the time of Henry III. a dispute arose as to boundary between the parishes of Shipley and Horsham; but in 1247 an arrangement was come to between Robert de Samford and the Prioress of Ruspur whereby the boundaries were amicably settled. Horsham has been a Parliamentary borough since 1295. On the passing of the Reform Act, however, it lost one of the two members it had been entitled to return to Parliament, as the total electorate was below 300. That it was a place of commercial importance is proved by its having a "Merchants' Guild" from very early times. The fact of the church being large also supports the theory that the population was considerable—although in the thirteenth and fourteenth centuries the size of a church did not so accurately represent the number of the parishioners as it did the liberality of the founder. Very probably, however, about this time Horsham was a populous parish, as by an endowment of the Bishop of Chichester in 1231 it was arranged that the vicar should be provided not only with a chaplain, but also a deacon and sub-deacon. Horsham during the fourteenth century was noted for the excellence of the arrows for crossbows, or "quarrels," as they were styled; and also horseshoes, a large trade in both of which was carried on. At the time of the Civil Wars feeling ran high between the Royalists and Roundheads. A quaint letter written at this time, now in the British Museum, gives one an idea of the state and feeling of the parties here and at Pulborough. The letter was penned by a Royalist, who signed himself "R. T.," and reads as follows:—

"With us at Horsaum, we are now 500 men in arms. The reason was this. Upon Friday, June 16 (1686), the magazine was commanded by the committee at Arundell; but our countrymen are generally so ill-affected that they rose with one consent, and two or three hundred appeared in an instant, leaving their mattocks and plows to rescue the swords and muskets."

This letter would seem to show that the inhabitants generally were on the king's side. A criterion as to what the feeling in the town was at the restoration of Charles II. is supplied in the fact that three of the principal inhabitants—Thomas Middleton, Edward Eversfield and John Eversfield—were selected by the "Merry Monarch" as knights of the Order of the "Royal Oak."

Bull-baiting was carried on for many years in the Carfax—said to be a corruption of "Carrefour" or "Quatrevoies," signifying where four roads meet—and, as we saw this afternoon, the last date on which this "popular sport" was indulged in was 1814. The rough element in the town were much annoyed at its abolition; and it was even stated, in defence of the Spanish custom, that the bulls enjoyed the sport, and had been known to escape from the fields at Chesworth and make their way to the Carfax in order to participate in the exciting scenes usually associated with the pastime.

\* A paper read by Mr. W. H. Truelove before the members of the Upper Norwood Athenæum.

It would be noticed that the roofs of some of the oldest houses are still composed of Horsham stone, or "slate," as it is very commonly called. This material belongs to an old geological formation which bears marks of sea or water ripples. In early times it was plentiful in the neighbourhood, being much used for roofing purposes, notwithstanding its weight, and that roof timbers had to be very substantial to carry such heavy "slates." It was a peculiarity of the town fifty years ago that the pavements were also composed of the same material, but these have given way to York stone and modern composites, and I have not seen any of the old pavements in my perambulations of the town, although a few still remain in the outskirts. A high price is now paid by builders for this stone when any of the old residences covered with it are pulled down, their object being to give newly-built houses an ancient appearance. Many interesting houses of the Middle Ages still exist in Horsham, notably the Manor of Denne—(on Denne, or Dane, Hill it is averred the Danes assembled to defend themselves against Alfred the Great, shortly after the death of Guthrum, their chief)—Hills Place, Causeway House and North Chapel. The two last mentioned we passed on our way to the church. North Chapel, a once famous building, supposed to have been a residence of the Hoo family, has been transformed into four cottages. Mention must also be made of the Grammar School, built in 1540 and restored in 1840.

There are four principal streets in Horsham, running at right angles almost due north, south, east and west, by which names they are called. Between the East and West Streets, but narrower, is Middle Street, known for very many years as Butcher's Row. Most of the shops and houses abutting on this street undoubtedly belong to the days of antiquity, and the projecting floors and overhanging gables point to the fact

CAUSEWAY HOUSE.

that it is the oldest part of the town. The Causeway, through which we passed in making our way to the church, was formerly a fashionable walk for ladies and gentlemen in the afternoon. In the centre of the town the old prison formerly stood at one extremity of an open square, which was known by the name of "Jail Green." Two weekly markets have been held for very many years, and four fairs are held annually in Horsham, two by a charter granted in 1461 to the Archbishop of Canterbury. Before the introduction of railways the turnpike roads through Horsham were remarkably good, several stage coaches passing through from London to Brighton. A daily coach, called the "Star," was noted not only for its speed, punctuality and safety, but for the civility of its driver, Robert (commonly called "Bob") Whittle, who for many years, six days in the week, started for London in the morning at a quarter to seven, and returned at eight o'clock in the evening, doing the double journey of 72 miles in eight hours. Horsham is now an important junction on the L. B. and S. C. Railway to Portsmouth.

## Horsham Church.

The parish church stands at the south of the town just above the river Arun. It is dedicated to St. Mary the Virgin, and occupies the site of a church of a still earlier date, the lower portion of the tower, and part of the north wall of which still remain. The round-arched doorway and narrow windows with their deep splays leave no doubt that this portion of the building belonged to the Early Norman period. The tower, adorned with grotesquely carved heads, is supported by massive buttresses surmounted by a spire, and is 230 feet high. It would be noticed that this spire is out of the perpendicular, the cause of which is attributed to the action of rain, wind and

sun on the massive timbers, it being built of wood, covered with shingles. The present church was erected against this tower in 1247, through the munificence, it is believed, of the nuns of the Convent of Rusper, who then possessed the rectorial tithes. It would appear that the original church was considerably smaller than the present edifice, as the width of the nave is much more than that of the tower. The church, including the tower, is 146 feet long, 53 feet 8 inches wide, and measures 47 feet 10 inches high. The regularity and simplicity of the design are at once apparent. The chancel and nave are uniform in width and height, and the aisles extend from end to end in unbroken lines. It is impossible to say what was the earliest form of the east window, but there is little doubt that it consisted of three simple lancets, one jamb of each of the side-lights having been found in the east wall. On the south side of the east window is a beautiful fenestella,

HORSHAM CHURCH.

a niche enclosing a piscina with a shelf above to act as a credence. Altogether, the building of the thirteenth century had been erected at the least possible cost, as there are traces of very little if any ornamentation. In 1307 the chantry chapel was built adjacent to the north aisle, the name it received being "the chapel of the Holy Trinity," a part of which now forms the principal entrance to the church. The style of architecture of this chapel is known as the Early Decorated. It contains an elegant window of two lights at the east end and two single lancets at the north end. During the alterations of 1864 a small lancet window was also discovered in the west wall, and the piscina (which is in a perfect state of preservation) was removed from the south wall to the position it now occupies in the east wall. There is also a vault or crypt 19 feet in length and 14 feet in breadth, with a vaulted roof, which communicates with the churchyard by a pointed arch in the north end. The object of this vault is not known, but there is no foundation for the statement that it was intended as a place of interment. In 1447 Richard Wakehurst and others obtained a license to found a perpetual chantry in the church, which was known as the "Boteler's chantry." It is also supposed that in 1231, when John de Braose granted the church and its appurtenances to the prioress and nuns of Rusper, that the brotherhood who officiated had an oratory in this church, which is now known as the "Shelley" chapel, being the burial-place of that well-known family.

The church in the fifteenth century was considerably altered, the lancet windows of each aisle being blocked up or replaced by others in Perpendicular style. The east windows of the chancel and aisles were similarly treated, the clerestory windows only remaining untouched. Some of the new windows showed considerable taste and skill, being remarkably fine specimens. From 1550 the church seems to have fallen into decay, and its stability was endangered, either by the sinking of the ground below the foundations or the excavations for vaults under the columns, causing the nave to lean towards the north and east; and at different periods steps were taken to prevent it falling in by masses of masonry and supporting girders.

In 1634 it was noticed that there were three coats of arms of the Mowbray family alone, and in the east window were no less than fourteen coats of arms of ancient families. The font

belongs to the fifteenth century, and is of Sussex marble, octagonal in form. The vestry is a large square building, and consists of two rooms, the upper one being used as a muniment-room. It contains a very large old chest, which must have been put together where it now stands. The lower room communicates with the church by a fine old oak door, which is probably coeval with the building.

The venerable church, owing to neglect and want of funds, however, was allowed to crumble and deteriorate until in 1864 its condition was seen to be a discredit to the town, and the thorough restoration of the building was taken in hand by a committee of the principal inhabitants. The restoration included "the reconstruction of the nave; rebuilding and adding a wing to the south aisle; removal of the galleries; reseating the church; readjusting and strengthening the roof; throwing open the fine entrance, through the belfry and tower-arch, into the church; providing for ventilation, light and warmth, and generally repairing the whole building."

The pews are now all of oak, the seats in the choir being a little more ornamental than the others. The stained-glass windows in the church are both numerous and beautiful specimens, but too much space would be required to enumerate all; still, mention must be made of the large east window in the Perpendicular style by O'Connor, the funds for which were provided by ladies of the parish. The restoration, which cost about 12,000*l.*, was completed by November 14, 1865, and the Bishop of Oxford preached at the reopening service.

#### Monuments.

There are three monuments in the church of especial interest. On the south side of the altar on a tomb with escutcheons is the effigy of Thomas, Lord de Braose, the last of the Chesworth branch of that family. It would be noticed that he is in the military garb of the time of Richard II., and his head is defended by a basinet, adorned with jewels, his arms and legs being in plate armour. The one on the north side of Purbeck marble belongs to the Hoo family, the canopy also being of marble. On the south side, behind the De Braose monument, is an altar tomb to the memory of Elizabeth, wife of Thomas Delves, who died December 2, 1654, and was only in her twenty-sixth year. On the chancel pavement is a brass figure of an ecclesiastic, the head and inscription of which, however, are missing. From the dress, and the letters T and C in the border of the embroidery of the cope, it is probably to the memory of Thomas Clark, vicar, who died in 1411. At the east end of the south aisle are two mural monuments—one to Robert Hurst, Esq., who represented Horsham in Parliament for many years, who died in 1843, aged ninety-three, and his wife and daughter; the other to Bonella Simpson, wife of a vicar of Horsham, who died the same year, aged forty-two. During the work of restoration a large number of monuments were removed from the walls and placed in the tower, including three of the Shelley family—Sir Bysshe Shelley, who died in 1815, aged eighty-three; Sir Timothy Shelley, Bart., died 1844, aged ninety-one; and Elizabeth, his widow, who died 1846, aged eighty-three. There is also one to the poet Shelley.

There is in the tower a curious brass plate, all in block letters, to the memory of a South London lady, which reads as follows:—

"In a grave near this spot lyeth y<sup>e</sup> body of Vrsula Slade who d<sup>d</sup> at Horsham Park 10 Novemb 1797 æt<sup>is</sup> 81. She was y<sup>e</sup> y<sup>t</sup> da<sup>r</sup> of Thomas Slade of Battersea in y<sup>e</sup> C<sup>y</sup> of Svrrey Esq by Mary his wife da<sup>r</sup> of George Vandyke Esq a collateral descendant of Sir Anthony Vandyke K<sup>t</sup>. This brass tablet was erected to y<sup>e</sup> memory of y<sup>e</sup> s<sup>d</sup> Vrsula Slade by her niece Sarah Smithe of Horsham Park in this parish."

On a stone slab near by is a memorial to a barber-surgeon named Pyke, of which the following is a copy:—

"In this seat here lyeth  
ye body of Thomas  
Pyke, Barber Chyrurgion  
who departed this life  
the 15th day of Novemb  
in the yeare of our  
Lord 1681, and in remembrance  
of him, this monument  
was erected by his  
brother John Pyke."

In the churchyard, but in different parts, are two stones with peculiar inscriptions. One of these is to a man, and all that appears on it is, "He was;" the other, to a woman, "She was." The splendid organ was built by Willis, of London. There is a fine peal of eight bells, the last two being added in 1752. The tenor bell weighs 23 cwt. 3 qrs. 16 lbs. Horsham has been a vicarage since 1229, the first vicar being Roger de Wallingford, who was appointed by the prioress of Rusper in 1231. The present vicar is the Rev. Canon Evan Daniel.

St. Mark's Church, in North Street, was erected in 1840 as

a chapel of ease to the parish church, the site being given by Mr. Thomas Coppard. In 1878 it was entirely remodelled for Canon Bridges from designs by Mr. Loftus Brock, F.S.A.

#### Chesworth.

What is now the residence of Mr. George Longley was in the thirteenth century a fine baronial house, with an extensive manor attached. When Edward I., in 1299, was travelling in the district he passed at least one night, June 30, in the house, and on September 2 and 3 in the same year, when journeying to Canterbury for the purpose of celebrating his second marriage, he also stayed there, the mansion at that time being possessed by Lord William de Braose, probably the seventh in descent from the De Braose who landed with the Conqueror, and who died in 1326. Edward II., two years before this event, had honoured the Lord of Chesworth with his presence, the date being September 4, 1324. It was from Chesworth this monarch gave permission to Stephen de Power to delay compliance with a proclamation which ordered him and all persons who owned lands valued at 40*l.*, or rent or fief worth 40*l.* a year, to take up arms fit for knights before Michaelmas. King Edward II. whilst here also granted a pension of 70*l.* to Wm. de "Brewosa," who, with his heirs, had given to him "the vill and castle of Brambre" and Shoreham, at which sum they were valued. The king's expenses when at Chesworth are stated to have been 10*l.* 19*s.* 3½*d.* It would appear that his daily expenses during this tour in Sussex amounted to about 11*l.* a day, as at Shepeley (Shipley) the day before they were within a few shillings of that sum, the details being:—Dispensary, 18*s.* 11½*d.*; butlery, 33*s.* 7½*d.*; wardrobe, 4*s.* 2½*d.*; kitchen, 20*s.* 1½*d.*; hall and chambers, 5*d.*; stables, 64*s.* 6*d.*; wages, 59*s.* 9½*d.*; and alms, 4*s.* From an inventory made in 1547, the house consisted of eighteen rooms, besides the hall, chapel and offices, among the latter being the kitchen,

CHESWORTH.

pantry, scullery, brewhouse, bakehouse, slaughterhouse and smith's forge. A chamber and bedstead were also attached to the latter, the slaughterhouse also containing beds. In the chapel attached, which was said to have been "handsomely furnished," there were a number of altar cloths. Most of the furniture of the house, also the hangings and curtains, are stated to be "olde and woryn," but as it had probably been in the De Mewbray and Howard families for very many years their "ragged" appearance is not to be wondered at. This inventory also gives the number of bedsteads in the house as 21; there were also 74 feather beds, but only 118 blankets, 13 "pillars" of down, and 9 mattresses; no more than 2 chairs are given, but there were 11 tables with "trestylls."

Thomas, Duke of Norfolk, who was arrested for high treason, and executed on June 2, 1572, appears to have been the last personage of importance who lived at Chesworth, and from a survey made in 1638 the house and premises were stated as being in a very dilapidated condition, and rapidly falling into decay. Mr. Charles Eversfield subsequently became lessee, by whose descendants it was afterwards purchased. They also built Denne as a family seat, and it is probable a portion of the old ducal home was pulled down and the materials used for the new residence, as when Denne was repaired about the middle of the last century oak timbers of great antiquity were found there. It is averred that a subterraneous passage existed between Chesworth and Denne, but Mr. Longley's son informed me no trace of such a passage had been discovered. Although Chesworth stood low, it was surrounded by a moat, portions of which, as we saw, still remain. The chapel is now divided into different departments,

and serves the purposes of kitchen, dairy and storehouse. This chapel was probably added to the house about the middle of the fifteenth century, judging by the architecture of the existing remains. Bedrooms at one time ran across the upper part of the chapel, but fire destroyed many of these long ago. The present appearance of the old baronial manor is a fair-sized farmhouse. The original form of the house is uncertain, as it was much altered and repaired during the last century, but it probably towered higher than at present. Numberless are the traditions that could be noted in connection with this old-time residence if space permitted, but we are assured of this fact—for many centuries it was the home of the oldest baronial families of the land, and several times the kings of England bearing the same name as our present beloved Sovereign supped and slept there.

#### The Poet Shelley.

With Field Place, on Broadbridge Heath, is associated the birthplace of the Sussex poet—Percy Bysshe Shelley. Beyond this there is nothing remarkable about the house, which I am informed has been considerably altered at different times, the portico having been added to the original building. The mansion is now occupied by Major and Mrs. Travers (through

FIELD PLACE.

whose kindness we were permitted to inspect the room in which the poet was born), but the Shelley family are expected to again be in residence there in September. The poet, as we saw from the plate in the bedroom, was born there on August 4, 1792. His grandfather, Sir Bysshe Shelley, of Castle Goring, was an eccentric personage, and spent the last twenty years of his life at Arun Cottage, a small farmhouse in Horsham. He was succeeded by his son Sir Timothy, who married Elizabeth Pilfold, and the poet was their eldest son. Percy spent his first few years at Field Place, his sisters being the boy's only companions, and he shared their education for a time. Having no male friends, he never acquired a taste for the sports and games common to boyhood. His first school was Sion House, Brentford, but he was far from happy there, being subjected to much rough usage. At thirteen Shelley was sent to Eton, where his whole spirit rebelled against the ill-treatment meted out to him by both masters and boys. When only eighteen he passed on to Oxford, and at that age wrote "Queen Mab," having previously composed several poems while spending his vacations at Field Place, which gave such evidence of genius that they were printed for private circulation. Whilst at Oxford, it is said, he would read for sixteen out of the twenty-four hours, and subsisted chiefly on bread. Among other peculiarities of his nature, he would throw stones into a pond for hours, sail paper boats or shoot at a mark with the duelling pistols carried in his pocket. He was fond of Greek and the physical sciences; indeed, he studied hard whilst at University College, being set down as a recluse. With a Mr. Hogg he published a pamphlet with the title of "The Necessity of Atheism," which aroused a storm of indignation, resulting in both being expelled from the College. At that time (1811) he was engaged to a cousin, of whom he was passionately fond, and his expulsion resulted in the engagement being broken off and his father being much displeased with him, especially as he would not break off Hogg's acquaintance. He came to London and was allowed 200*l.* a year by his father. His sisters, too, sympathised with him, and sent him many gifts through a Miss Harriette Westbrook, whom he married, after a short acquaintance, at Gretna Green, although she was much below the poet in social position and not at all suited to him. Two children were born of the marriage, but

after three years they separated, and his wife shortly afterwards committed suicide by drowning. Shelley wished to regain possession of their two children, but the Court of Chancery forbade him removing them from the custody of Mr. Westbrook, their grandfather, who had settled 2,000*l.* upon them. This caused the poet much grief, as he was set down as a profligate. Shelley passed the summer of 1814 in Switzerland, where he made the acquaintance of Lord Byron, and shortly after his wife's death in 1816 he married Miss Mary Godwin, the authoress of "Frankenstein," with whom he went to Italy. He never afterwards returned to his native land. "Alastor," his first mature poem, was written just prior to his first wife's death. At Rome he wrote "Prometheus Unbound," undoubtedly his finest composition, and from 1818 to 1822, when he too was drowned, his intellect and pen gave evidence of vast energy by the number of poems and other pieces produced. It happened on July 8, 1822, while returning in his own boat to Lerici, on the bay of Spezzia, where he resided. Always fond of the water, he had just previously purchased a small yacht, and, in company with a Captain Williams and a boy named Vivian, they left Leghorn, whither he had been on a visit to Lord Byron and Leigh Hunt, when suddenly a storm arose, and the boat went down almost instantaneously, all three perishing. Their bodies were washed ashore, and, in accordance with Italian law, cremation followed, among those present at this sorrowful function being Lord Byron, Leigh Hunt and Captain Shenley. Notwithstanding Shelley's many eccentricities and peculiarities, he had a large circle of friends, by whom he was held in high esteem. He was liberal, and, when he had the means at command, even generous, striving in his own way to serve his generation. While there was in his life much to regret, we as Englishmen cannot but admire his genius and the beauty of the poetical music he has bequeathed us. Among the miscellaneous poems by which he is best known, the "Ode to the Skylark" and "The Cloud" give undoubted evidence of the master hand, in addition to showing his grip of human nature, as the following well-known lines undoubtedly demonstrate:—

We look before and after,  
And pine for what is not;  
Our sincerest laughter  
With some pain is fraught;  
Our sweetest songs are those that tell of saddest  
thought.

#### Warnham,

like its near neighbour, Horsham, is in the Hundred of Singlecross and the Rape of Bramber. The manor was held by William de Saye in 1272. The church, in the Early English style, is dedicated to St. Mary, the tower belonging to the Norman period. This is said to be quite as old as Horsham church tower.

WARNHAM CHURCH.

A chantry, dedicated to St. Margaret, is mentioned, under date of 1518, by Cartwright in his description of the church; he also speaks of the site of an altar-tomb, with three shields and quatrefoils, of the time of Edward I. To Sir John Caryll, Kt., who died in 1613, and his wife, Maria, there was a monument in a good state of preservation. The Michells, who preceded the Shelleys at Field Place, are also commemorated.

A marble tablet, with elaborate pillars, on the south wall near the chancel, is in memory of Frederick Murray Lucas, youngest son of Mr. C. I. Lucas, who died suddenly from

cholera at Surat, in India, while travelling round the world in 1887. He was only in his twenty-eighth year.

In the Shelley chancel are several curios, and the village stocks are there fastened to the wall. We also noted the huge padlock on the chest near by.

The pews are all oak, as are the entrance door and the beautiful chancel screen.

In 1847 it was enlarged, and in 1886 Mr. C. T. Lucas, of Warnham Court, spent some 9,000*l.* in restoring the sacred edifice. The chancel was then rebuilt, the floor relaid with marble mosaic and several additions and alterations carried out.

The living is in the gift of Mr. Lucas, the present vicar being the Rev. R. Bowcott.

Near Warnham Pond, where the poet Shelley in his childhood passed many happy hours with his miniature boats, is the mansion of the Carylls; and Warnham Court, before referred to, is a handsome mansion built in the Elizabethan style.

Gentlemen, I thank you for favouring me with your company and for the patient hearing you have given these "rambling" remarks, which have principally been obtained from Miss Hurst's book on "Horsham" and Lower's "History of Sussex." We have in ideal spring weather covered new ground abounding in many historic details, and my hope is all have enjoyed and will retain pleasant recollections of the tour made this afternoon in the neighbourhood of Horsham.

The illustrations are from photographs by Mr. Charles Wheeler, Mr. Henry Virgoe, and Major Travers.

### SOCKBURN, DINSDALE AND HAUGHTON-LE-SKERNE.

A LARGE party of members and friends of the Architectural and Archaeological Society of Durham and Northumberland visited Sockburn, Dinsdale and Haughton-le-Skerne on the 5th inst. Shortly after 10 o'clock the company left Darlington railway station in brakes, and drove to Eryholme, on the Yorkshire side of the river Tees, passing *en route* through picturesque scenery. Eryholme Church was viewed. It is an interesting building. About fifteen years ago, as explained by Mr. C. C. Hodges, it was restored. In the carrying out of the extensive scheme certain features of antiquarian importance were removed, but, thanks to Mr. Hodges, the visitors had the satisfaction of seeing, through the medium of photographs, interior and exterior, the ancient edifice. Though much of the latter had actually gone, nothing Mr. Hodges stated, had been destroyed, excepting a lancet window at the east end of the aisle of the nave. The architecture of the church is late Norman, excepting the chancel, which is of the Decorated period.

At Sockburn, the next place visited, there was abundance to engage attention. The ruins of the old church, which carry one back in thought to pre-Conquest times, derive a special attractiveness from their close and prolonged association with one of the oldest families of the north, namely, the Conyers. The privilege of being upon the historic spot was enhanced by remarks from Dr. Greenwell, who said that it appeared in every way probable that the site would be occupied in prehistoric times, though there existed no real proof of that. In the reign of Henry VIII. Leland referred to it as being "of ancient time the very inheritance of the Conyers." The name Sockburn seems to have been originally Soccesburgh, or the buhr of a soke, a franchise, a buhr being a fortified place. Under Anglican occupation there was a church and cemetery at Sockburn. That there was a cemetery there was proved by the finding of sepulchral crosses and grave covers. In the year 780 or 781 they had historic notice of Sockburn, Highbald being then consecrated Bishop of Lindisfarne. Then in 796 Eanbald was there consecrated Archbishop of York. Consequently it must have been a religious house of some importance. In the year 883 Guthred, redeemed from slavery and made King of Northumbria through St. Cuthbert, presented the place to the latter, and so it came into the possession of the Church. Early in the eleventh century Sockburn was given by Flambard to Roger de Conyers, who held the land by presentation of a falcion to the Bishop of Durham, then Prince Palatine. The falcion was exhibited, and Dr. Greenwell referred to the legend to the effect that a member of the Conyers family had slain a worm with the weapon. From Roger de Conyers descended a long line of Conyers, who branched off into a great number of lines. The family, in fact, remained at Sockburn for many centuries, and became a very important house, not only in the county of Durham, but also throughout Yorkshire and other parts of England. Dr. Greenwell knew of no other house which had spread more widely, and yet he did not think there was left a Conyer of the male line, and very few of the female line. Sir Thomas Conyer, in fact, the last baronet of the line, got into such impecuniary circumstances in 1810 that

became an inmate of Chester-le-Street workhouse. By subscription a fund sufficient to take him out of that institution was raised, and he died some years later in possession of a decent income. There were still living representatives of the male line, Sir Thomas having several daughters who married into humble life. They were, Dr. Greenwell continued, indebted to Sir Edward Blackett for having taken the most anxious care not only of the ruins, but also of valuable stones which until lately had been entirely neglected. Sir Edward instructed Mr. Knowles to roof the ruins of the Conyers chapel, into which those interesting relics had been placed. Mr. Knowles gave an account of the ruins and of the work he had done for Sir Edward Blackett. At Sockburn, he said, they had evidence of two Saxon churches. A fine mailed effigy of a Conyers of the early part of the fourteenth century, together with ancient crosses and grave covers, were also described by Mr. Knowles, after which Mr. Hodges put before the company a few details of the falchion.

Resuming their tour, the archaeologists in due time reached Marsdale, the parish church of which was the subject of remarks by Mr. Knowles, Dr. Greenwell and Mr. Hodges. The last-named gentleman called special attention to a memorial stone, upon which is recorded the death of a member of the Surtees family in 1360. It is the oldest English inscription of the kind in stone relating to the family, according to Mr. Hodges. Haughton-le-Skerne Church contains much of Saxon or Saxonized architecture, and within its walls the party spent a delightful half-hour. Recent renovations and alterations have, in the case of Eryholme, deprived the edifice of not a few of its attractions. Much of the handsome old woodwork, however, remains, the pews, pulpit, stalls, &c., being conspicuous in that respect. Mr. Hodges's references to these were received with evident gratification, as were also his observations upon the general architecture of the church.

Upon their return to Darlington the party dined at the North-Eastern hotel.

## CUMBERLAND AND WESTMORELAND ARCHÆOLOGICAL SOCIETY.

THE first meeting of the season of this Society was held last week in the Gosforth district. The party assembled at Sellafield on Wednesday, the first day, and there took coach to St. Bridget's, Beckermeth, where Mr. W. G. Collingwood described two very old crosses and a stone altar slab. He said the inscription upon one of the stones was at one time supposed to be Runic, but that idea had now been abandoned. It was probably Manx of the eleventh or twelfth century. Dr. Parker described the bells of the church, which were of the pre-Reformation period. From St. Bridget's the party drove to Beckermeth, where after luncheon they had an opportunity of inspecting the relics collected by Mr. J. D. Thompson, of Warwickstead. They had mostly been found in the neighbourhood a few years ago during the draining of Gib Farm. Among them were stone hammers, axes and other implements, middle-clubs, a sword club, a canoe and various other subjects of interest.

The Rev. W. Gabbot afterwards received the party within St. John's Church, Beckermeth. Here six ancient crosses, four slabs, many grave slabs and two pitchpipes were inspected and observations were made with regard to some of them by Mr. Collingwood and Dr. Parker. Mr. Collingwood, referring to one of the crosses, said he had been told that in all pre-Norman dragon crosses the eye instead of being nearly circular comes to a little point at one side, and when that little point looks forward the carving is Irish, but if it looks the other way it is of Danish origin. If that was so, then in this case the little point on the eye showed this cross to be of Irish origin. That was very interesting as indicating the close connection of early Irish Christianity with the missioning of this part of the country, and the coming over of the Irish in the tenth and eleventh centuries. The interlaced crosses began with the Newcastle Cross, 681; the Irish introduced later forms in the tenth and eleventh centuries, and in the twelfth century there are still interlaced works done.

Dr. Parker made some remarks on the fonts and some other features of the church. There was a thirteenth-century font, the finest in Cumberland, traditionally supposed to have come from the chapel situate where Caernarvon Castle used to be, but it was far more rational to suppose it was from the site of the earlier church there. That no doubt was an Early English church, and some of the remains showed that it was of very great beauty. There was a pre-Reformation font which could hardly be later than 1500. Outside was an enormous grave slab, which no doubt covered the grave of a Fleming, of Caernarvon Castle.

The coaches proceeded to Calder Abbey. The weather aided by this time got out fine and warm, and for the remainder of the day was most genial and enjoyable. Stopping just outside of Beckermeth Dr. Parker pointed out the site of Caernar-

von Castle, and gave a lengthy account of what was known of it. It never was a castle in the proper sense of the word. All trace of it would have been lost but for an account of it written over 200 years ago in the Le Fleming pedigree and elsewhere. As the name is British there can be little doubt that a tribe of Britons or "Welsh" had their caer or encampment on or around this hill from a very early period. It was probably a stronghold of the post-Roman Britons.

Proceeding to Calder Abbey, the party viewed the ruins and had them explained to them very lucidly and with great detail by Dr. Parker. Everyone was highly pleased with this part of the programme. Mr. Rymer received the visitors personally and with the greatest cordiality and kindness, and every facility was afforded for seeing these noble ruins and their beautiful surroundings. The abbey was founded in 1134 by the second Ranulph de Meschines (son of William de Meschines, the founder of Egremont Castle) possibly during his last illness, for the health of his soul, for he died shortly after. The abbey was a church, hospital and school in one. The ruins were plundered of their stone and changed hands through a succession of modern owners. The abbey was finally purchased by the late Mr. Thomas Rymer, who spent a large sum of money in repairing it and preserving it against further dilapidation.

After viewing the ruins, the party was entertained to refreshments by Mr. Rymer, who afterwards accompanied them on foot by way of the Long Walk to Calderbridge, where the coaches were regained at 5.30.

The next visit was by coach to Ponsonby Church, which was restored in 1874. It has a thirteenth-century chancel arch, and in the windows are some fragments of old stained-glass probably brought from Dalegarth Hall. The church was given to Conishead Priory in the thirteenth century, and at the Dissolution fell to the Crown, from whom the Stanleys bought it about 1689.

Coaching back to Seascale, the party arrived for dinner at 7.30, after which the annual meeting of the Society was held, and the evening was spent in the reading of a number of papers.

The programme of the second day included a visit to the Danish Camp on Windhall Farm, Gosforth; and visits to Gosforth Hall, Gosforth Church and Irton Hall and Cross.

## JOHN RUSKIN.

A LECTURE on "Ruskin as I knew him, and as he has impressed me," was given by Sir W. B. Richmond, R.A., at a meeting of the Ruskin Union. It was longer ago, he said, than he could definitely remember when he first saw John Ruskin at the house of his (the lecturer's) father, George Richmond, R.A., who met him in 1838. Ruskin contracted a close friendship with the family. His masterful and engaging personality, so magnetic and stimulating, acting on the minds of children, could not fail to impress on them an indelible stamp. Whether one agreed with all the master thought or not, his influence on one's mind stuck fast and inspired the desire for beauty, not only in art but in life. The position of Ruskin was now assured, and the great master stood out for ever as a shining light to this century. The first impression he produced on one's mind was that he was immensely opinionative, which was true; but he had a good right to his opinions. He prided himself on his critical powers, but he was distinguished by great modesty. No one was more critical of himself, and the style was so convincing that his criticism of himself added strength to his inspiring power. He was characterised by great kindness, consideration and nobility, and there was not the least vanity or snobbishness in his nature. He suggested that the Ruskin Union would do well to organise an exhibition of Ruskin's works, with the object of promoting a knowledge of the master's many-sided genius.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon a large party of members of the Association visited St. Monans, Balcaskie and Pittenweem. At St. Monans the fine old church was visited, and an historical account of it was given by the Rev. John Turnbull, Mr. P. Macgregor Chalmers, architect, afterwards describing the work he had recently carried out on the ancient building. Mr. Henry F. Kerr, president of the Association, congratulated Mr. Chalmers on the work of restoration he had accomplished, and also moved that Mr. Baird, of Elie, who defrayed the cost of restoration, be accorded a vote of thanks and appreciation for doing so much to preserve the old church. The party then drove to Balcaskie where, through the courtesy of Sir Ralph Anstruther, the house and gardens were visited and greatly admired. The drive was continued to Pittenweem, and the old church, priory and lane were inspected. The visits were full of interest, but the enjoyment was greatly marred by the rain, which fell in torrents towards evening. Sir James Graham, mayor of Sydney, was among the party.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE summer examination of the Scotch candidates took place in Glasgow in the School of Art Building, 167 Renfrew Street, by favour of Mr. F. H. Newbery, headmaster. The examinations were in charge of the president of the Glasgow Institute of British Architects, Mr. Horatio K. Bromhead, assisted by Messrs. John Hutcheson, T. L. Watson, A. M'Gibbon, Jas. Lindsay, Wm. Fraser, Jas. Lothead, and were concluded in the rooms of the Glasgow Institute of British Architects, 187 Pitt Street, on the 12th.

## THE NATIONAL GALLERY AND WOODEN STANDS.

THE First Commissioner of Works, says the *Times*, admits that the responsibility for the erection of wooden stands for Coronation Day in close proximity to the National Gallery rests primarily with his department; but he states that the Trustees of the National Gallery have been kept fully informed of what (following the precedent of 1897) has been going on, and that they have raised no objection. No pains have been spared to secure the safety of the Gallery, and the stands are watched at night by police stationed there for the purpose, such police being visited at intervals by the chief police officer in charge of the building. The hose is connected at six points, and all is ready for immediate use. Hand-pumps have also been supplied. By the courtesy of the County Council, Mr. Akers-Douglas arranged some weeks ago that all the stands should be visited by firemen periodically, and that Captain Wells should advise as to any steps which he might consider necessary, having regard to the adjacent buildings. His recommendations will in all cases be carried out, and in the meantime fire-buckets, hose and other appliances are kept in the utmost readiness at the National Gallery, and the staff are advised to be constantly on the alert. Similar precautions as to watching, and as to the provision of hydrants and fire-hose, have been taken in regard to all stands which have been erected by the Office of Works.

## THE STRAND CRESCENT.

THE report of Mr. Norman Shaw and Mr. W. E. Riley, the County Council's superintending architect, on the eight designs sent in for the erection of buildings proposed to be erected fronting the Strand and on the crescent road to be formed between Wellington Street and Clement's Inn, has been printed. After the public exhibition of the designs, and the receipt of the experts' report, the envelopes were opened and were found to be as follows:—No. 29, Mr. Leonard Stokes; 27, Mr. William Flockhart; 26, Mr. Henry T. Hare; 23, Mr. Ernest George; 21, Mr. Reginald Blomfield; 20, Mr. Mervyn Macartney; 19, Mr. Edward W. Mountford; 17, Mr. Ernest Runtz. Mr. Norman Shaw and Mr. Riley in their report and say:—

We have studied the eight sets of designs submitted for the proposed new streets from Holborn to the Strand with great care and with the deepest interest, and we are pleased to be able to report that in our opinion the architects invited by the London County Council have made a most admirable response to the invitation.

Throughout there is the strongest evidence that each architect has done his very best, and has left no stone unturned to produce a design which in his opinion would be worthy of this great opportunity, and though there may be a difference of opinion as to how some have succeeded, it is a great pleasure to be able to record the fact that not merely has a great effort been made, but that the measure of excellence attained is exceptionally high. Moreover, each one has endeavoured to present a commercial adaptation of his design for the consideration of the Council, and has carefully observed the instructions issued, so that we have no hesitation in reporting that condition iii. has been amply fulfilled. (Condition iii. provided that the designs should be in conformity with the Council's instructions.)

It would be both unnecessary and invidious for us to go through all the designs and to attempt to allot to each what we conceive to be its relative place. Mr. Norman Shaw desires personally to say that he would rather have limited his recommendation to one design only, but as we have been requested to select the three best designs, we venture to submit the following remarks:—

It is with feelings of unalloyed satisfaction that we observe that the authors have almost unanimously adopted a large

measure of restraint in their designs instead of the very full and varied developments to which we have been too much accustomed in our street architecture for some years. We have in these designs, mostly, quiet and dignified proportions more or less academic in character. We invite attention to this point as there can be little doubt but that the result of these great "Improvement Schemes" which the Council is carrying into practical effect will exercise immense influence on the architecture of London and also the country generally; and it is hardly necessary to dwell on the extreme importance of this being a good influence. It is much to be regretted that the eight architects were not given some indication of the style to be adopted, as we feel that time has come when the hesitation between the claims of the called Classic and Gothic treatments and the constantly disturbing influences of foreign architecture must cease if we are to make any real progress, and that we shall do better in the future if we adhere more closely to the great examples we have of the English Renaissance and follow on the lines bequeathed to us by such truly great masters as Inigo Jones and Christopher Wren.

It is remarkable, however, that with no limitation of style eight architects should have been found whose views and were so closely governed by the influences of the Renaissance, but if the limitations of English Renaissance had been adopted it would, in our opinion, have simplified the task and insured a more direct and probably a more satisfactory result. It is this absence of limitation of style which has necessitated the comparing designs which are in some respects not easily comparable, and our adjudicating on productions which we find difficult to approach without some tinge of prejudice.

After much deliberation and careful consideration of all circumstances and particulars of the conditions under which the invitation was issued, we have agreed on the following recommendations:—

We place No. 26 first. The author has dealt with the plan in a simple and ingenious way, and has overcome the difficulty of skill of treating the various street corners. The main lines of the setting out as originally approved by the committee are not materially departed from. Drury Lane and the corresponding street on the east side of the new road are shown to be arched over. Perhaps it may be considered that this would not be admissible, but it adds much to the artistic treatment of the façade. The architect of this design has dealt with the Strand front as devoted to a public building, but he shows thorough appreciation of artistically adapting other portions of the improvement to commercial purposes. On the whole, the treatment is such that the committee might reasonably expect lessees to carry out designs not inferior to these in point of cost.

We place No. 27 second. This architect deals with the commercial adaptation of the design quite as literally as No. 26. It is much to be regretted that he has adopted a decided French bias, as there is much skill and artistic feeling in the drawings, and we feel that if he had kept within the tradition of English Renaissance the result would have been much better suited to the grand site which is intended to be treated, but the skill and power shown in the design cannot be set aside on that account, as style was evidently not intended to govern the issue. This design would probably be more economically carried out than No. 26, and therefore has under that head, claims to attention; but we repeat the regret that the influence of French architecture has been so perceptible in a design which is intended for one of the finest sites in British capital.

We place the design of No. 20 third. In its artistic value it is very unequal. The arrangement on the plan for the circus at the south end of the new street to Holborn is a simple and dignified suggestion. The elevations for the north side of the curved streets are, however, feeble, but this appears rather to be due to the poorness of the drawings. Other portions of the design, especially the alternative design for a public building, possess great dignity and show scholarly perception of the importance of the site. It would, however, probably be more costly to carry out than No. 26. It may practically be considered the most expensive of the three.

We desire also to offer a word of comment on the very carefully thought-out block plan of No. 29, but the proposed amendments are, on the whole, not an improvement on the simple treatment of the Council's property suggested in the other designs, though the Somerset House extension is a conception which, if properly worked out, would add great dignity to the scheme.

It must be borne in mind that all the designs are little more than preliminary studies. We do not see how it is possible to suppose that they can be in any sense fully matured, as the governing conditions of plan, which are so helpful in designing elevations, are necessarily absent at this stage, and in selecting the above-mentioned designs we have been largely influenced by a feeling that they possess elements capable of being developed into works of great excellence.

## FOREIGN ART STUDENTS IN ITALY.

THE Foreign Office has received from His Majesty's Chargé d'Affaires in Rome the law regulating entry, without payment of the ordinary fee, to the national museums, libraries, excavations and monuments of Italy, which has been approved by the Royal Decree of April 13, 1902. The privilege of free entry is by the law accorded to foreigners who—(a) artists; (b) art students and art critics who have issued worthy publications; (c) professors of archaeology, history, literature and art; (d) pupils of archaeological, historical and institutions, students in the departments of literature and philosophy, and in schools of practical engineering. Applications for a general permit for free entry to all museums, &c., must be sent to the Ministry of Public Instruction on stamped paper of 1 lira 20c., with an unmounted photograph (of the applicant) not to exceed 5 centim. by 8 in size. Applications for free entry to archaeological and artistic institutes in a large town must be sent on stamped paper of 60c. to one of the heads of the institutes; and if the permit is required for more than a month a photograph must be sent of the size mentioned. The applications must be accompanied by the following documents: for persons under (a) and (c), by an academic document *visé* by the Italian diplomatic representative or consul in the country to which the applicant belongs, or by the diplomatic representative of that country in Italy. For persons under (b), by one of the publications which they have published. For persons under (d), by an official document showing that they stand on the books of the institutions mentioned under that heading, for the year in which they apply. The document must be *visé* as in the case of the documents furnished by persons under (a) and (c). As His Majesty's diplomatic representative in Rome is not always in a position to authenticate without previous inquiry documents issued by institutions in the United Kingdom, art students, &c., are recommended to have such documents countersigned by Italian consular officers in this country before leaving.

## GREEK ART IN TURKESTAN.

THE Royal Geographical Society on Monday Dr. M. A. Stein, of the Indian Educational Service, gave an account of his archaeological discoveries in the southern portion of Chinese Turkestan, and particularly in the region of Khotan, made during his journey expressly undertaken by him at the instance of the Indian Government for archaeological explorations in 1900-1. The plan of explorations had been suggested to him by the reports and evidences of a series of antiquarian discoveries made in and around Khotan which had been acquired by the political agents of the Indian Government in Kashuni, Liak and Kashgar, as finds made by native "treasure-seekers" in the distant desert region of Khotan. A curious feature of these discoveries was that they contained not only undoubtedly ancient documents in Indian and Chinese characters, but also a large proportion of manuscripts and "lock-prints" in a surprising variety of entirely unknown scripts, and antiquaries were greatly puzzled by them. Leaving Calcutta in April 1900 and passing through Kashuni and Ghit, Dr. Stein reached Kashgar at the end of July. There a month was spent in familiarising the provincial Chinese Government with the purpose and character of the expedition, and throughout his long journey Dr. Stein appears to have received most intelligent and sympathetic assistance from the authorities of the province. Fortunately he was able to quote them the records of Hinen Tsiang's travels in this same region early in our own Christian era, and he remarked that all educated Chinese seemed to have read or heard legendary accounts of the famous Chinese pilgrim's journey to the Buddhist kingdoms of the "western countries." On September 11 he set out for Khotan, which he reached a month later. Much surveying had been done on the way, but at Khotan the expedition settled down to exploration. No site in the Taklamakan desert had offered such yields to the local treasure-seekers as the one known to them as Dandan Uiliq, and a week's march through shrivelled and gaunt trunks of trees, long since dead, lying in the sandy waste brought them to the ruins that had been rifled by the treasure-seekers. But systematic excavation, with sufficient supplies to pursue the work, had their reward, and revealed large numbers of stucco images and reliefs, mosaics and painted wooden tablets, all showing representations of saints and legends of sacred Buddhist lore—long lost relics of that Indian art which had found a second home in Buddhist Central Asia before spreading further into the Far East. Leaves of paper manuscripts came to light in Sanskrit, and documents written in Indian Brahmi characters, and some were dated with years corresponding to our eighth century, showing that Dandan Uiliq must have been abandoned, probably gradually, about that time. But reports came of a more ancient site fifty miles further east, where a young adventurer from Niya had picked up wooden tablets in an ancient Indian script belonging to the first century of our era.

Concealing his delight, Dr. Stein went off through the jungle and found, on January 27, 1901, the site of buried civilisation eleven miles from north to south and over four from east to west. Diligent research disclosed articles of ornamental wood carving, elaborately worked chairs, broken pieces of arms, household implements, musical instruments, broken pottery and over 200 documents of wood of all shapes and sizes, with Chinese writing, and Indian Kharoshthi documents on leather. Each document was provided with a carefully fitted covering piece, on which was inscribed the "docket" mark and fastened with string and a clay seal to give trouble to the curious. A frequently recurring seal, probably that of an official, showed the figure of Athene with shield and aegis, and another fine seal was that of a well-modelled nude figure of pure classical outline, probably of Eros. Others, again, showed classical figure outlines but barbarian features. Here was a discovery, therefore, which showed that classical art had penetrated halfway between Western Europe and Pekin. The early speculation of Hinen Tsiang is thus confirmed—that the territory of Khotan was conquered and colonised two centuries B.C. by Indian emigrants from the North-West Punjab. Another 100 miles march through the desert to another ancient site yielded similar discoveries, and back again at Khotan. In April Dr. Stein set out to the North-West to find Rawak, where the excavations revealed a remarkable series of colossal statues in stucco representing Buddhas, and painted reliefs and frescoes. The supporting woodwork of this treasure of sculpture had rotted away, but some of the smaller sculptures were brought out in good preservation. Dr. Stein subsequently had the pleasure of wringing a confession from Islam Akhun, who had manufactured the "treasures" in "unknown" scripts, which he had imposed on British officers and had so bewildered learned archaeologists.

## TESSERÆ.

## The Sceptre.

AS an ensign of royalty the sceptre is of greater antiquity than the crown. It was more especially characteristic of Asiatic manners, so that among the Persians whole classes of those who held high rank and were invested with authority, including eunuchs, were distinguished as the sceptre-bearing classes. The sceptre descended from father to son, and might be committed to any one in order to express the transfer of authority. Those who bore the sceptre swore by it, solemnly taking it in the right hand and raising it towards heaven. The original wooden staff, in consequence of its application to the uses now described, received a variety of ornaments or emblems. It early became a truncheon, pierced with golden or silver studs. It was enriched with gems, and made of precious metals or of ivory. The ivory sceptre (*eburneus scipio*) of the kings of Rome, which descended to the consuls, was surmounted by an eagle. Jupiter and Juno, as sovereigns of the gods, were represented with a sceptre. With the kings of France of the first race the sceptre was a golden rod as tall as the king himself. One sceptre of Charlemagne is 7 feet long, and so is that of Clotaire II.; but there are short sceptres also contemporary. The Anglo-Saxon sceptres are surmounted with crosses, a fleur-de-lis or a bird. A king of the eighth century has a long staff with a plain knob, but the short sceptre also occurs in the ninth century. The sceptre was distinguished from the verge. The staff of Edward the Confessor formed part of the ancient regalia. The verge was the symbol of Government and administration; the sceptre the mark of Imperial dignity. Sovereigns not only concluded treaties by the reciprocal delivery of these verges, but further used them to invest their successors in the supreme authority. Aristotle says that the sceptre was the symbol of truth, by which kings swore to judge with equity. The sceptre and verge for the left hand both occur, says Selden, in Anglo-Saxon coronations.

## The Sphinx.

What the Egyptians signified by this symbolical figure seems not to be exactly decided. It was probably the type of womanhood in which power is engrafted on beauty and gentleness. This they represented by a woman's face, neck and bosom, terminating in the body of a lioness, not in fierce or violent action, but in eternal repose. This is the nature of the passive principle, which receives within itself the germs of life and quickens and brings them to perfection, without any external manifestation of energy. Possibly also the Egyptians meant to insinuate that though the female sex is placed as our companion upon earth, it is never understood by us, but will remain, like the sphinx, an enigma to the day of doom. However, this may be taken for granted that the approximation of sphinx and pyramids was not altogether accidental. The stranger and the traveller who approach might learn from the mystic figure beneath the rocks that around him all was symbol and allegory, and that if he could not read the riddle of its existence he could scarcely expect to interpret the most

abstruse of all symbols on the sacred mount. In all ages there has been an esoteric philosophy, a doctrine and language confined to the few, and even now they who as travellers journey over the surface of the earth must veil a portion of their discoveries behind an obscure terminology. When perfect the sphinx, in all likelihood, formed the crown of Egyptian art. There is something inexpressibly majestic in the dusky head, suggesting the idea of a buried goddess, emerging from beneath the sands; and if we contemplate the outline of the features, and restore what centuries have mutilated and marred, we shall probably have a perfect type of the beautiful as it existed in the mind of the Egyptians.

### English Crowns.

The first crown properly so called was that which appears upon a coin of Ædred, the son of Edward the Elder—a circle of gold surmounted with three small globes; but after the introduction of it a diadem or circle of gold was still worn. The Conqueror's crown was a circle or coronet of three rays, having pearls on the points crosswise, and between the rays fleurs-de-lis. William Rufus had a radiated or Eastern crown, with pearls on the points like an earl's coronet. In those forms they appear on their great seals. The coins have a diadem or circle, with a string of pearls in the middle and three rays with a pearl on each point. On some of Rufus's crowns arches of pearls appear. The crown of Henry I. shows three fleurs-de-lis, without any rays intermixed or pearls at the ears. Stephen's was an open crown fleuri. Henry II.'s crown consisted of points or pearls, commonly five, a cross in the middle of pearls; or a crown fleuri, three rows of pearls upon the circle. A crown fleuri belonged to Richard I. John's was similar; on his great seal rays like an Eastern crown appear. The great seal of Henry III. has a crown, with leaves like a ducal coronet; on his coins it has a thick line raised in each end, a large pearl in the middle, a fleur-de-lis, and three pearls or points below. The crown of Edward I. and Edward II. had also ducal leaves; on coins the crown has three fleurs-de-lis, with two rays or lesser flowers between. From Edward III. to Henry VI. the crown appears to have had leaves, three fleurs-de-lis and two rays between. On the great seal of Henry VI. an open crown fleuri with small pearls is introduced. The great seal of Edward IV. and Richard III. shows the double-arched or imperial crown; on the coins it is open. The crown of Henry VII. has crosses patée and fleurs-de-lis on the great seal; on the money a crown of one arch, with little crosses thereon saltirewise, surmounted with the orb and cross. The circle was composed of crosses patonce (the cross attributed to Edward the Confessor), a larger and smaller alternately. The seal has sometimes one arch, sometimes two; but from this time the arched crown, with crosses patée and fleurs-de-lis alternately, has been constantly used with very little variation, except upon the first money of Henry VIII.

### Freemasonry in England.

Nicholas Stone destroyed many valuable manuscripts belonging to the Society of Freemasons. Perhaps his master, Inigo Jones, thought the new mode, though dependent on taste, independent of science, and, like the Caliph Omar, held what was agreeable to the new faith useless, and what was not ought to be destroyed. In Malden's "Account of King's College Chapel, Cambridge," "Dr. Henry's History," and a "Treatise on Masonry," by William Preston, 1792, some account of the Freemasons, as relating to the subject of building, may be found. They appear to have been known in England about the beginning of the seventh century. They are said to have introduced the art of building in stone, and that the art of constructing walls to resist the thrust of a stone vault was their original mystery. It is more reasonable to suppose that the art of building stone walls is as old as stone quarries than that this society is as ancient as Solomon's Temple. About the beginning of the seventeenth century the art "de la coupe des pierres" was still held a secret, and the possessors of this mystery were called the "Cotterie." Maturin Jousse called his treatise from this circumstance "Secret d'Architecture."

### GENERAL.

The King has been pleased to give permission to Mr. Henri Favarger to accept and wear the insignia of the Third Class of the Imperial Ottoman Order of the Osmanieh, conferred upon him by His Highness the Khedive of Egypt, authorised by His Imperial Majesty the Sultan of Turkey, in recognition of his services to His Highness as Government Architect for the Prisons.

The King of the Belgians opened the exhibition of Early Flemish art in Bruges on Sunday. Many works have been obtained from English collections. The exhibition will not be closed until September.

Mr. F. W. Pomeroy has received the commission for a statue of the late Lord Dufferin to be erected at Belfast. It will be completed in two years.

The Court of Common Council have resolved to erect a crematorium at the City of London Cemetery at Ilford, at an estimated cost of about 7,000*l.*, subject to the approval of the plans by the Secretary of State.

The Act passed by the Prussian Parliament last session authorising the Prussian district authorities to prohibit the disfiguration of picturesque spots by the erection of open advertisements has been published in the official *Gazette*.

A Committee has been formed with the object of raising funds to establish cottage homes for disabled and deserving men of the 6th Inniskilling Dragoons. The homes will be established in memory of the fallen officers and men of the Inniskillings.

Messrs. John Barker & Co., Ltd., have arranged with the London County Council to erect a large block of buildings with a total area of about 21,600 feet, on the north side of Kensington High Street. The ground-rent will be 3,150*l.* per annum. There will be also a new building in Cromwell Crescent. The estimated outlay is 120,000*l.*, which will be raised by debenture stock.

Westminster Abbey is to be opened for a time after the Coronation, in order that the general public may have an opportunity of seeing the decorations and other arrangements carried out by H.M. Office of Works.

A Statue of Père Didon, the Dominican preacher, is to be inaugurated in the park of the Albert-le-Grand College at Arcueil. The work has been exhibited in the Salon, and is by M. Denys Puech.

Messrs. Merryweather & Sons, Greenwich, have entered into a contract with the London County Council for the supply of six new double-cylinder vertical steam fire-engines. These are to be fitted with all the latest improvements, including expansion gear and oil-fuel burners.

M. Charles Gérault has been elected member of the Académie des Beaux-Arts in succession to M. Coquart. He won the Prix de Rome in 1880. Among his works are the crypt and tomb of Pasteur and the Petit Palais in the Champs Élysées.

Mr. H. L. Storey has offered the sum of £10,000 towards the erection of a technical school in Lancaster which is to be in keeping with the Institute erected by the late Sir Thomas Storey.

The John Usher Institute of Public Health was formally presented to the authorities of Edinburgh University on the 11th inst., and an address was presented to the donor by the students.

The Directorate of the Universal Exposition, St. Louis, are offering a prize of 2,000 dols. (about 400*l.*) for an artistic design for a seal. The emblem or design must symbolise the history of the great Louisiana territory and its purchase by the United States from France in 1803. Fuller information may be obtained, by letter only, from the Resident Representative of the Exposition, Mr. George F. Parker, Sanctuary House, Tophill Street, Westminster.

A Request to the Council of the Society of Antiquaries to summon a special meeting to consider the question of afternoon meetings at 5 o'clock instead of evening meetings at 8.30 (as at present) is now being circulated amongst the Fellows. The request has already received 251 signatures, including five peers, eleven other persons of title, the Deputy-Keeper of the Public Records, the president of the Royal Academy, the director of the National Portrait Gallery, Norroy and Ulster Kings of Arms and seven other members of the Heralds' College, sixteen directors and officials of museums and libraries, eight cathedral dignitaries and four professors of universities.

The Corporation have made arrangements for the complete illumination of the City of London School, Victoria Embankment, and also Blackfriars Bridge. The Embankment from Westminster Bridge to Blackfriars Bridge will be illuminated by thousands of Japanese and ornamental lanterns, while Venetian masts, surmounted by gold spear-heads and bearing large national banners, will be fixed between the electric standards, each of the latter having a trophy of flags with a shield in the centre bearing the Royal monograms E. R. and A. R. Each mast and standard will be connected by festoons of garlands. Blackfriars Bridge will be illuminated with prismatic gas globes arranged in festoons, chandeliers of coloured globes being placed at equal distances.

Mr. James Brown Lord, who was one of the prominent New York architects, died on the 1st inst. His latest work was the marble Court House in Maddison Avenue, New York, which is the most remarkable of the modern public buildings of America. He was born in 1859.

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**THE CORONATION.**

**THE ARCHITECT** will be published on **WEDNESDAY, JUNE 25.** All Advertisements, Tenders, and Contracts Open intended for insertion in that issue must be received at the Office, Imperial Buildings, Ludgate Circus, not later than **3.30 p.m. on Tuesday, June 24.**

**COMPETITIONS OPEN.**

**COOMBE HILL, NEAR AYLESBURY.**—July 19.—Designs are invited for the Bucks War Memorial (a stone monument 50 feet high). Mr. R. J. Thomas, M.I.C.E., County Hall, Aylesbury.

## TRADE NOTES.

MESSRS. THE RATNER SAFE COMPANY, LTD., inform us that  
they have been instructed to supply over 50 Ratner safes to  
the canteens of the various temporary military camps situated  
in the different London parks during the Coronation festivities.

THE inhabitants of Leven, East Yorkshire, have decided to  
erect a large hour striking clock as a permanent memorial of  
the Coronation of King Edward VII. The order has been  
placed in the hands of Messrs. Wm. Potts & Sons, clock  
manufacturers, Leeds.

A LARGE clock and chimes is now being erected in  
St. Mary's Church, Warwick, which chimes the Cambridge  
quarters, strikes the hours and shows time on four 6-foot 8-inch  
dials. It has all the latest improvements. The work is being  
carried out by Messrs. John Smith & Sons, Midland Clock Works  
Derby.

AT the second ordinary general meeting of R. Waygood &  
Co., Ltd., held at the Cannon Street Hotel on Monday last, a  
further dividend was declared at the rate of 10 per cent. per  
annum for the six months ending March 31, 1902, making  
with the interim dividend already paid, 7½ per cent. for the  
year on the ordinary shares, a balance of 3,698½ ls. 7d. being  
carried forward.

THE Lift and Hoist Company, engineers and revolving  
shutter makers, of Premier Ironworks, Deptford, draw our  
attention to the fact that they fitted the lift at Upton Cottage,  
Slough, of which we gave an illustration last week. They also ask  
us to state that architects are invited to inspect their "Premier"  
dinner lifts, which are absolutely noiseless in action. These

6 Laurence Pountney Hill, Cannon St., E.

can be seen in all parts of London and the country, and can be arranged to work direct into the dining-room, and they guarantee that their service lifts are absolutely silent.

APROPOS of the recent deplorable conflagration in the city, Messrs. Merryweather & Sons, whose fire-extinguishing and life-saving apparatus are so well known, have prepared a series of illustrated descriptions of their various appliances which, as many of our readers are aware, comprise, in addition to fire brigade appliances as engines, escapes, &c., fire escape staircases in various forms, chutes, &c., some form of which should be compulsory in all institutions, factories, and, indeed, in all buildings of any size where large numbers of persons are congregated or employed.

### SANITARY JOINTS.

THE ordinary method of joining a lead soil-pipe to the nozzle of an earthenware water-closet is, to say the least of it, clumsy, and the result is not always reliable or satisfactory. We have

measured, therefore, having regard to the importance of the subject, in calling attention to an ingenious device for overcoming the difficulties hitherto attendant upon the operation referred to, which has been put forward by Mr. John Stewart, Merchiston Avenue, Edinburgh. This is a screw coupling

and socket, appropriately called the "Victor" union, by means whereof a lasting and effectual tight joint can be made for connecting lead pipes with earthenware closets, as well as fire-clay drain-pipes, with the expenditure of but little labour and in a very economical manner.

The joint is, as shown in the annexed illustration, made in three parts, and the main feature to be noted is the application of the screw in such a simple way as to enable plumbers to turn out more efficient work than by the ordinary method, while the cost is sufficiently moderate to permit of sanitary authorities adopting it for all classes of property. The *modus operandi* is for the plumber to hermetically secure the socket, with a hold screw cut on the outside, on the nozzle of the closet. The lead pipe is then fixed between the tapered part of the socket and the wedge-shaped collar by the outer coupling ring, which screws the whole together, so as to render it absolutely gas-tight.

To sum up the matter, the following are the advantages claimed for the joint in question:—In the first place, the objectionable solder and putty joints are entirely done away with; then there can be no breaking of joint through shrinking of woodwork. It is worthy of note also that the closet can be fixed up last of all, after the woodwork is fitted and painted, while it can be removed at any time without disturbing the pipes; and, lastly, the "Victor" union will, we are assured, stand any reasonable pressure test which may be applied to it.

### PATENT SEATING FOR PUBLIC RESORTS.

THE matter of economising floor space in connection with the seating accommodation in halls, concert-rooms, school-rooms and other public resorts is one of considerable importance, and to seat comfortably a considerable percentage more of an audience than is usual on a given floor space, as well as the provision at social gatherings of seating adapted for easy removal when required, with the minimum of storage room, are advantages that obviously cannot be overlooked in the present day.

In this connection we may call attention to the patent

## TAYLOR'S PATENT JUNCTION "

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the any angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. The Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, it is necessary to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Pipe 2 inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and screw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left as with all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

1—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.  
2—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.  
3—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1 1/2 in. Invert Junction for Anti-siphon Pipes, &c.  
4—Shows how to arrange for a small sized branch.

made in Three Strengths—Ordinary Rain Water, 1/2 and 1/4 Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

specialties in seating, designed with the express purpose of affording the facilities named, which have been put upon the market by Robertson's Furniture, Ltd., of Netherlee, Cathcart, near Glasgow. Their patent folding forms particularly, for

public halls, churches, schools, &c., possess the profitable advantage of being folded and packed into one-fifth of their open breadth; that is to say, five forms fold flat into the breadth of one open seat, and forty forms flat are, as regards space, only equivalent to eight open seats. They are, moreover, easy to fold and pack out of the way, thus giving freedom of floor space when required, as they can be stored under the platform or distributed round the walls inside.

Then, again, Robertson's patent automatic chairs are apparently of considerable value where space is limited, as the occupant rising tips the seat out of the way, and thus they afford greater facilities for seating or dismissing an audience than those ordinarily in use, while in time of panic, should that unhappily occur, they would cause no obstruction. Another advantage is that they afford greater economy in room, and give, it is claimed, fully 15 per cent. more of an audience in parallel rows over any other fixed or portable chairs

hitherto in use, so that they become a source of perpetual increase in revenue. It is also important to note that they permit of freedom of floor-space, as when not in use they fold and pack together into a remarkably small compass, and, moreover, an audience can be seated with these chairs spaced 24 inches apart, while ordinary Windsor chairs require 27 to 30 inches to seat with equal comfort.

### ELECTRIC NOTES.

OWING to the successful working of the Shoreditch electric lighting department it has already been found necessary to erect a new and much larger power station. This has been constructed in Whiston Street, on the banks of the Regent Canal, and on Monday afternoon it was formally opened in the presence of a large and interested assemblage.

At a meeting of the Birmingham Museum and School of Art committee on Monday, presided over by Alderman Right Hon. William Kenrick, Professor Frankland, of the University, submitted his report on the tests made by him with respect to the atmospheric conditions in the long gallery with and without artificial illumination. Substantially the report was to the effect that the incandescent gas lighting is not only not prejudicial to the pictures in the long gallery, but that it carries off through the ventilating shafts much of the impurities ordinarily present in the atmosphere. The report will be printed and circulated among the members of the Museum and School of Art gas and electric-light committees, but until they have had an opportunity of considering it no action will be taken in the matter.

### BUILDING AND BUILDERS.

THE plans have been passed for the new dispensary at Hartley Hill, Leeds.

THE memorial-stone of a new Presbyterian church, which is being built at Ilford at a cost of 5,300*l.*, was laid on the 13th inst.

MEMORIAL-STONES for the New Free Methodist church and Sunday school combined, now being erected at Worksop, were laid last week.

PLANS were last week laid before the Coatbridge Dean and Guild Court of a new church to be erected as one of the churches in the extension scheme of the Presbytery of Hamilton. The plans show accommodation for 700 sitters, and the estimated cost is about 9,000*l.* The application was continued.

THE foundation-stone of the new church of St. Luke's, which is to be erected on the site of the old building, which was razed to the ground in 1899, was laid on the 12th inst. The new church has been designed by Mr. Edward Mansell, of Temple Row, and it is estimated that the cost will be about 13,000*l.* It will be built in the Perpendicular style, of brick with stone

ings, and a prominent feature will be the tower, at the corner of Bristol Road and St. Luke's Road. It will accommodate about 800 persons.

SEVERAL small homes, which have been erected at Tooting for the deserving poor, were opened last week. There is already in connection with the Wandsworth and Clapham Union a Home for Aged Poor at Tooting Bec, where, after certain number of years in the workhouse, certain inmates are drafted on. Here the system of granting rooms to old married couples has for some time been tried with great success, and now these cottages have been built in the grounds of the home, giving to twenty-three couples the comfort of a little home to themselves.

THE foundation-stones of a new Congregational church were laid on the 16th inst. at Small Heath, Birmingham. The site is situate in a thickly populated district at the corner of Watery Lane and St. Andrew's Road, and adjoins the present Congregational school buildings, in which for some time past religious services have been held. When furnished the new edifice will cost about 3,000l. It will be erected in red brick with stone dressings, and will provide seating accommodation for between 400 and 500 persons.

AT a meeting of the Hamilton, N.B., Town Council a report by the public libraries committee was submitted as to visits they had made to municipal buildings at Clydebank, Govan, Perth and Coatbridge, and they recommended that no definite resolution be come to to proceed at once with the municipal buildings, but that the library be erected without delay. The style of architecture and accommodation of the Sandeman Library at Perth had commended itself to the committee as being a suitable library for Hamilton, with such

alterations as might be necessary in order to have one entrance-hall for municipal and library buildings. The report was adopted.

A SOMEWHAT curious occurrence is reported from Aldershot. It appears that a number of builders were engaged on a new building for the commanding officer of the Army Service Corps. One of the labourers, named Pharo, was ascending a ladder with his hod full of bricks when he suddenly fell to the ground, a distance of 30 feet. Several men rushed to the spot and caught him in time to break the fall. It was then seen that he had been shot through the right arm by a Lee-Metford bullet. At the same time it was discovered that another man had been struck by a bullet, while a third man received a bullet through his waistcoat and had a narrow escape. No report was heard, and the affair is a mystery. Pharo is in the hospital, but the other man hit was only slightly injured.

THE memorial-stones were laid on the 14th inst. at Bradford of a new mission hall which is to supersede the Eastbrook Wesleyan Methodist chapel, which, owing to the dispersal of its original congregation, has recently been used for mission purposes, for which it had at last become quite unsuited. The new building will be in the form of an amphitheatre, octagonal in shape, and every seat will be in full view of the platform. There will also be a minister's vestry, a sisters' room, &c. It is further proposed to erect shops or offices facing into Leeds Road, at a cost of 7,000l., the rents from which, it is hoped, will more than cover the interest on the total outlay.

It is proposed to considerably extend the accommodation at Rugby School. Old Rugbeians and others are being asked to subscribe to the fund, and already a sum of nearly 8,000l. has been given and promised. Almost immediately the authorities intend to proceed with the erection of a chemical laboratory, near the racket courts, and the addition of three classrooms near the school chapel, and the larger scheme embraces the building of a new school on what is at present the school-house garden. Here there will be a natural history museum, classrooms, masters' rooms and offices, and the principal entrance will be from the Barby Road, at a point opposite the gate leading to the Close.

A GREAT impetus is being given to Wesleyan chapel extension in all parts of British Methodism owing to the anticipated early distribution of grants from the Million Fund. Within the past few days sanction has been given by the

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

general chapel committee for the erection of thirty-three new chapels, twenty of which are to be built in populous localities or rural districts where at present Methodism is unrepresented. The estimated outlay on these new chapels is 71,300*l.*; the sitting accommodation to be provided is for 10,300 worshippers. With the connexional aid to be afforded, the temporary debt on these new buildings will only be 12,500*l.* In addition there are forty cases of enlargements, also new Sunday and day schools and some ten new organs, bringing up the total estimated outlay to nearly 110,000*l.* In the list are the following local cases:—Leeds (Holbeck), a new chapel in Renton Terrace, to supersede the present wooden building; estimated cost, 1,100*l.*; sitting accommodation for 300. Rotherham, a new chapel at Clifton, to take the place of present school; the cost of the new building is 1,780*l.* At Grange-over-Sands, 750*l.* is to be expended on erection of hall and new Sunday school. New Sunday school at Idle, to cost 4,502*l.*, to provide for 300 scholars. At Waltham Street, Hull, 5,155*l.* is to be expended on vestries, church parlour, &c. The outlay on Doncaster (Oxford Place) schools is 1,000*l.*, leaving a debt of 200*l.* At Woodhouse Grove a new Sunday school is to be provided, at a cost of 2,036*l.*

### VARIETIES.

THE church at Cairndow, Argyllshire, which has been renovated, was reopened on the 12th inst.

THREE acres of land near the centre of Bury have been given by Lord Derby as a site for a new grammar school. He has made an offer of another gift of 1,000*l.* in addition.

THE new goods station of the North-Eastern Railway at Falsgrave, Scarborough, is now open for traffic. The warehouses and offices have cost about 9,000*l.*

THE foundation-stone of the new church of St. Ignatius, Stamford Hill, a mission founded by the Jesuit Fathers, was laid on Saturday by Cardinal Vaughan.

WE are glad to hear that Mr. Hawk, architect, Pontefract, who was seriously injured by a cycling accident near Scarborough, has regained consciousness, and is progressing favourably.

THE list of candidates for the town clerkship of Leicester has been further reduced. The choice of the Town Council now rests between Mr. Hiley, deputy town clerk of Birmingham,

ham, and Mr. Jarratt, town clerk of Southport. The final selection will be made on June 24.

A CROWDED ratepayers' meeting, convened by Llangollen Council, has been held to consider the proposal for strengthening Llangollen town hall, which is declared unsafe. The Council desired approval to expend 1,800*l.* to secure the building, with the addition of a convenient gallery. Councillor Pencerdd Williams, chairman, declared that the walls overhung 4 inches. After some lively passages, the meeting appointed four local experts to collaborate with the Council to solve the difficulty.

THE completion of the works in connection with the Whitechapel and Bow Railway has resulted in considerable spaces of ground being cleared in the vicinity of the stations. One of these sites, which includes the well-known Black Boy public-house at Stepney Green station, has come under the attention of the Stepney Borough Council, and a suggestion has been made that it should be acquired by the Council for the erection of workmen's dwellings. The cost, however, would be too great for the Borough Council to undertake, and it has been decided to bring the question under the notice of the housing committee of the London County Council.

THE parish church of St. Michael's, Dawlish, has been greatly enriched by filling in the niches with statuary. The series consists of four of the more prominent Old Testament preachers on one flank, and four of the New on the other, the central figure of St. John the Baptist forming the connecting link. A niche in the adjacent pillar has been repaired, and a figure of St. Michael placed in it. These figures, which are in Caen stone, as well as the graceful tabernacle work of the niche, are the work of Mr. Rogers, of St. Sidwell's, Exeter, who has succeeded admirably with respect to both the features and attitudes of the several statuettes. The low stone screen has also been adorned by the same sculptor with conventional carving, and a polished marble coping adds greatly to the dignity of its appearance.

THERE appears to be an almost general exodus of all excursion steamers down South for the Coronation Review, leaving Coronation week practically a blank so far as Londoners are concerned who wish to make trips. The Belle Steamers, however, in spite of tempting charters, have decided to run their largest steamers, *London Belle*, *Southend Belle*, &c., on their regular service as usual during Coronation week, and also on Friday, June 27, in addition, Yarmouth service and Husbands

boat excepted. This will afford the public who have to start their holidays in that week the opportunity of making the journey by water as hitherto, and shows that so far as the Belle Steamers are concerned they can depend upon an uninterrupted service when making their arrangements ahead.

THE new Baptist church at Muswell Hill was opened on the 17th inst. It occupies a commanding position in Duke's Avenue, and is built of red brick with white stone dressings in a modified Gothic style. On the right of the main entrance rises a bold tower with a spirelet, and on the left hand a dwarf tower, both containing fireproof stairs to the galleries. The interior is very light and pleasing. The ceiling is vaulted in wood and supported by wide arches and surmounted by an octagonal dome. This is useful as well as ornamental, for it is ingeniously employed for the purposes of ventilation. The whole seating accommodation is arranged in a semicircular fashion, so that every one of the 800 or 900 persons can see and hear admirably. The acoustic properties have been tested and found very satisfactory. The architects were Messrs. J. A. Baines, of Clement's Inn.

DURING the recent excavations in clearing out the foundations of the old parish church at Forthingall a find of considerable interest to antiquarians has been unearthed. The relics were dug up from beneath the flooring of the church, and comprise a number of pieces of ancient sculpture, three or four cross-slabs with old Celtic sculpture. The slabs and other relics were shown to the Rev. John McLean, of Grandall, who suggested to the parish minister, Mr. Campbell, that they should be submitted for examination to Dr. Anderson, of the Society of Antiquarians, Edinburgh. The Doctor, having examined the stones, states that they are exceedingly interesting, showing characteristics of local art, and making Forthingall a centre of Celtic sculpture. These interesting relics, after being figured and placed on record by Dr. Anderson, will, it is understood, be preserved within the fabric of the new parish church now in course of erection on the site of the old church close by the famous yew tree, which is thought to be more than 2,500 years old.

At a meeting of the Ramsbottom District Council, on the 17th inst, the chairman (Mr. John Garnett) and several members replied to the strictures passed by the Local Government Board inspector at a recent inquiry held into an application for sanction for borrowing £14,850 for sewerage and sewage disposal purposes. The chairman denied that the

Council had been extravagant in the sewage scheme, and pointed out that the scheme had been sanctioned by the Local Government Board before the formation of the District Council, and that the Council had been tied hand and foot both as regards the design and designer. Therefore if there was any blame the department must take its share. He contended that the inspector did not give the Council the slightest credit for the work done in trying to remedy the mistakes of their predecessors from 1895 to 1898. Mr. Rostron said the matter referred to by the inspector at the inquiry was passed by the Local Government Board, who never raised a scintilla of doubt as to the feasibility of the scheme. When the present Council was formed they knew little about the treatment of sewage and placed almost implicit confidence in the advice of the Local Government Board.

### AMERICAN STEEL CONSTRUCTION.

SIR MARTIN CONWAY, professor of art in Cambridge University, does not share in the views of the president of the American University in Cambridge, Mass., regarding the architectural beauty—or lack of beauty—of New York city. President Eliot said recently that New York was about as ugly as they make them. Sir Martin Conway says, on the other hand, that Broadway from the Battery to Madison Square, and then Fifth Avenue on, is the most beautiful street in the world. But he admits that this beauty is found to no small extent in the promises for the future that the buildings along the street contain. He says that the skyscrapers of New York are just now of more interest than any other buildings in the world, because better than any other they hint at the style of architecture that will be the style to-morrow.

"The architecture of the future will be the architecture of steel," he said recently to a group of American callers. "It will be an entirely new style, and it had its birth in Chicago only a brief twenty years ago. There have been three great styles in the past—the simple uprights and the crossbeam style of the Egyptian and Greek temples; the rounded arch style, which the Romans worked out from a suggestion borrowed from pre-Athenian Greece; and the Pointed style of the Gothic builders. All other styles have been variants or combinations of these. The materials have been wood and stone, and the problems to be met in the past were the problems of construction. An entirely new style is now

being evolved, and is studied best in New York. Anything can be done with steel. Barrel vault or dome or pointed arch can be thrown up at will, and the structure can rise to a height of thirty storeys. The problem is much less one of construction and much more one of pure style. We can meet at will all the structural problems that vexed the old builders, and use at will the decorations which time taught them were most in keeping with the structural plans they adopted. The field for architects of the future is immense and as wide as the globe.

"The style of the future will be most beautiful. Already in many of the skyscrapers you seem to think so ugly I see hints of this beauty. To those who have seen the buildings of Greece and Rome the churches of the Middle Ages must have seemed ugly, but in those very churches were being worked out and developed the structural principles which resulted in the cathedral of Paris and the perfect spire of Chartres. Now such of those churches as are left us we find beautiful by the light reflected back on them."

"There is no reason why the steel skyscrapers should not stand the vibration for a thousand years, so no doubt the day will come when Americans will look back on many of the buildings now going up in lower Broadway and find them beautiful, just as we now see beauty in the early Gothic churches. Let us look forward and see in them a style in the making."

"Structurally this style will be the simple square principle of the Greeks, the Girder style, for that is the cheapest. But as the general proportions of the skyscraper are different from the low buildings of the Greeks, the style of ornamentation cannot be made the same, nor can it be the style of the Gothic, which was adopted for pointed buildings, and, moreover, ecclesiastical. Many attempts to use these styles are seen on the towering structures in New York, and too often the result is unhappy. These square steel buildings might be covered with wall-paper if one desired. Neither stone nor brick nor wood is essential to the structure. How shall the steel skeleton that is the real building be concealed and ornamented and made beautiful to look upon? The proportions are like nothing before built in the world, unless it be the Tower of Babel. They are reared for use. How make them lovely?"

"They are the buildings of the future, so our question is, What is the style of the future to be?"

"Your architects are working out the answer. The University Club in Fifth Avenue is a beautiful building, fit to stand in Venice or Florence. Many of your architects have treated the

storeys, or groups of storeys, the windows and cornices of tall buildings of steel in entirely new and beautiful ways. I shall not be surprised myself to come back to New York thirty years and see your tall buildings covered with tiles arranged in patterns or even in pictorial design. Think of a forest of sky-scrappers on lower Manhattan Island all standing up in shining colours and sending back the sun."

Sir Martin paused to allow the conception to come home to the men with whom he was talking. Spoken very quietly, his words did not at once carry the wild, Babylonian splendor of the picture.

"The theory of a level skyline on a city street does not appeal to me," he said. "I know of no more beautiful sight in the world than lower Manhattan viewed from Jersey City at sunset. That wilderness of towers of Babel, each with its roll of smoke, is a sight so majestic, so genuinely beautiful that it can never be forgotten. It is a pity that the splendid idea of a triumphal arch of entrance on the Battery was not carried out. The finest street in the world should have the finest entrance. There should be a fitting door to the land that holds the future of architecture in its keeping."

### CLINKER BRICKS EXPERIMENT.

THE conversion of clinker refuse into a commercial product of value is the problem which the Corporation of Brighton, with laudable ambition, have set themselves to solve. They are already making a profit, says the *Sussex Daily News*, out of the conversion of some portion of the refuse into mortar, and they desire to transform a large proportion of the residue into bricks. Their earnestness and public spirit will no doubt be rewarded. Only on the 5th inst. did they appoint a deputation to visit the Netherlands, to see the brick-making-from-clinker-refuse works of Mr. A. Kahl, at The Hague, and since then the deputation have inspected the establishment, seen some of their own clinker-refuse shaped into bricks, and have returned to Brighton. This they did on the 13th inst. Here is an example of commendable celerity in public work, and the achievement is very creditable to the deputation. It was necessary for them to go to Holland for the desired information. Several municipalities, it is true, make paving-slabs from clinker-refuse, but the surveyor does not favour this mode of its utilisation. The slabs would be unsuitable for use in Brighton, whereas he could largely consume the bricks, and those he did not want would

no doubt be readily purchased by builders of the town. The deputation's rapid visit to Holland must have left them little time in which to inspect the fine buildings of that handsome city, The Hague, and their journey to Gloucester to witness the slab-making works of Messrs. Fielding & Platt will, no doubt, turn out to have been effected with similar expedition.

For a full appreciation of this important matter, it is well to recall the facts. The destructor at Hollingdean, then, dealt with 27,061 van loads of house refuse in 1901, the residue representing 9,000 cartloads of old tin, clinkers, and ashes. The tins were flattened, and sold at 2s. 6d. per ton, and 1,285 of the loads were made into mortar, and freely sold (the demand being in excess of the supply) at a profit of 87d. 10s. Road and pavement foundations took 1,544 loads, 1,177 loads were given away, and 4,994 (say 5,000) loads were carted to Black Rock, as playthings for the wild waves. The point is, what is to be done with these 5,000 loads? Upon this, the expert advice of the surveyor is the guiding element. Prior to the visits in question, he indicated that a clinker-crushing plant might, at an outlay of 855*l.*, be installed for dealing with 1,500 of the 5,000 loads, thus smashing the large, hard clinkers into such small pieces as to render them suitable for the formation of moulds for concrete, in lieu of beach. After allowing for interest on, and repayment of, the amount of the outlay, spread over fifteen years, together with 52*l.* per annum for labour, the surveyor values the broken clinkers at 187*l.* 10s., or 61*l.* 4s. 1d. net profit, to which would have to be added 225*l.*, the present cost of cartage to the devouring and profitless sea. Now we come to the main body of the refuse—the 3,500 loads, described as fine clinker and ash. Mr. Kahl would provide a plant capable of turning it into 8,000 bricks a day—less carriage, but including an engine, the necessary machinery with belting and shafting—for 2,720*l.*, Messrs. Fielding & Platt, of Gloucester, estimating for a brick-making and drying plant of the same capacity for 1,630*l.* A slab-making plant by Messrs. Fielding & Platt, capable of turning out twenty to twenty-five slabs per hour would cost 1,150*l.* These estimates do not include the cost of buildings, foundations, or the erection of the machinery, and the surveyor puts this cost at about 800*l.* So much for the outlay.

As to revenue, Mr. May was advised that the 3,500 loads of clinker-refuse would yield 1,000,000 bricks, at a cost—including interest and repayment of capital—of 13s. per 1,000, or a total of 650*l.* If the bricks were sold at an average of 8s. per 1,000, the clear profit would be 750*l.*, to which would

have to be added the saving of 525*l.* on cartage; or 3s. per load, including wear and tear of carts. The total profit would be 1,275*l.*—an appreciable sum, and worthy a struggle to obtain. The slab-making would, apparently, yield a greater profit. If 34,240 yards sup. of slabs could, as had been said, be realised from 3,500 loads of clinker-refuse, and sold for 4s. per yard sup., then slab-making would show a net profit of 1,809*l.* per annum; but, for reasons stated above, the surveyor prefers the brick-making, and brick-making will no doubt be undertaken. It might be advantageously stated here that the members of the Corporation of Birmingham are among the dozen or so municipalities that have engaged in slab-making. They commenced in October 1897, spending (exclusive of foundations) 2,000*l.* on hire plant. A similar plant could, of course, be bought to-day for less money. The plant was paid for out of revenue. In 1899 the production of square yards of slab amounted to 8,860; in 1900 to 12,106, and in 1901 to 9,582. The slabs, used chiefly for footpaths, were 2½ inches thick, faced with granite, and the cost of producing one such slab was 2s. 2d., the selling price ranging from 2s. 6d. to 3s. 3d. These particulars may help the surveyor to give the *coup-de-grace* to the disfavoured idea of slab-making. So what probably has to be faced is the outlay of 855*l.* 10s. for clinker-crushing plant, yielding an already explained profit of 286*l.* 4s. 1d., and an expenditure of, say, 2,430*l.* for brick-making and drying plant, producing a profit of 1,275*l.* The total outlay on the Council's enterprise is, then, 3,315*l.*—unless they go to Holland for their plant, and then it will be 1,140*l.* more—and the total profit yielded will amount to 1,561*l.*, or 286*l.* 4s. 1d. on crushing-clinkers and 1,275*l.* on converting clinkers into bricks. A complicated representation is thus reduced into a form enabling "all who run to read."

#### ELECTRIC APPARATUS AT NORTH STAFFORDSHIRE INFIRMARY.

THE opening of the electric department at the North Staffordshire Infirmary has taken place. The equipment provides for continuous and alternating current baths, and has been designed and carried out by Messrs. Marshall & Woods, 2 Gray's Inn Road, Holborn, on lines suggested by Dr. Armstrong, of Buxton. The necessary power is taken from the mains of the Potteries Electric Traction Company to charge a large storage battery, which is capable, when fully charged, of

working the baths for fifteen hours before it requires recharging. The battery is controlled by a switch which completely isolates it from the bath apparatus when charging, and so avoiding any possible connection between high-pressure tramway current and the baths. A pair of wires are run from this switch to a board, where they are divided up into six pairs; one pair of these is for the machine that converts the continuous current from the battery into alternating or sinusoidal current; one pair go to the controlling board for the large bath, two other pairs go to two arm baths, and the remaining two pairs are in reserve. The machine consists of a motor and a dynamo coupled together and running at 3,000 revolutions per minute, this high speed being necessary in order to obtain the requisite number of alternations per second of the current. A pair of wires carry the alternating current from this dynamo to a board where they are divided into five pairs, one pair being for the large bath, two other pairs for the two arm baths, and the remaining pairs for spare. We thus have four wires going to each controlling board, two carrying continuous and two alternating current. By means of a switch on these boards, which are of polished marble, either kind of current can be turned on to the bath as required. A regulator is mounted on the boards for adjusting the current to the proper strength; and on the controlling board for the large bath are two instruments—a voltmeter for measuring the electrical pressure between the ends of the bath, and an ammeter for measuring the strength of the current flowing through the bath from which the strength of the current flowing through the patient can be calculated. The current is passed through the water in the bath from two tin plates, one at the head and one at the foot, a third plate like a paddle being provided to concentrate the current on any particular portion of the patient's body. The Röntgen rays are worked from an induction coil, capable of giving a spark 10 inches long in the air, which is driven by a separate set of portable batteries, controlled by a similar switch to that used for the large battery. This apparatus, which has been supplied by Mr. Leslie Miller, of Hatton Garden, London, is in a separate room from the baths, and partitioned off by heavy curtains to exclude all light. Two voltmeters mounted on a slate panel are fixed in the battery room for measuring the electrical pressure of the two batteries. It will be noted that provision has been made to allow of two more baths being installed, the only additional apparatus required besides the bath being a controlling board; and by these arrangements more baths can be electrically provided for

at a very slight extra cost—from which it will be seen that, in the apparatus at present installed, the governors of the North Staffordshire Infirmary have an equipment capable of considerable expansion, should its success create a demand for additional accommodation.

### BATHS AT NORTHAM.

At the last meeting of the Southampton Borough Council report was presented with regard to the condition of the bath at Northam, which were the gift of Mr. Tankerville Chamberlayne, M.P. In the report of the baths committee were the following observations by the borough engineer (Mr. Crowther) with reference to the Northam Baths:—"I have had this bath under close observation for the past two months. There is a very decided movement at the end of the bath nearest the river; as the tide rises this end of the bath floats, and as the tide recedes this end of the bath settles down; this continual motion has broken the bath completely across. I have had bore-holes made, and from the nature of the ground I am of opinion that it is not possible to make this bath watertight without reconstructing the same on a pile foundation. The Ferro-Concrete Constructions Company (Hennebique's patents) have submitted a scheme for the construction of a swimming bath in accordance with their patents and are prepared to guarantee the durability of their work for twelve months on the payment by the Corporation of 5 per cent. on the cost price. The company propose to construct this bath on a foundation composed of thirty-six ferro-concrete piles each about 25 feet long and 12-inch square. On the heads of these piles ferro-concrete beams 6½-inch square will be laid both longitudinally and transversely in such a manner as to bind the whole of the foundation into one mass. It is proposed to lay on these beams the flooring to form the bottom of the bath; this floor and the sides will be 5½-inch in thickness. The bath has been calculated to withstand any movement of the existing bath, and in the event of any further subsidence in the old bath the new one will remain in position. If this work is put in hand at once, the company's representative informs me that the bath will be ready for use in September. I estimate that the whole of this work will cost about 1,100/." It was resolved by the committee to adopt the scheme submitted by the borough engineer, and, subject to the approval of the finance committee, to recommend the Council

### "GALILEO FERRARIS AWARD."

A committee for the "Galileo Ferraris Award," which was formed in 1898, being composed of the representatives of the five committees for the General Italian Exhibition held in 1898, of the Chamber of Arts and Commerce, of the Academy of Science and of the Royal Industrial Museum in Turin, have determined to open an international competition for the award of the prize on the occasion of the unveiling of the monument to that illustrious scientist in Turin in the latter part of the month of September next. The award is of 15,000 lire (600*l.*), together with the compound interest accumulated since the year 1899 up to the day of the award, is to be granted to the inventor of some practical application of electricity from which some noteworthy progress may be made. Competitors may produce either pamphlets, schemes, drawings, or machines, apparatus and contrivances concerning their invention. The jury, composed of the committee, has full power to cause practical experiments to be made of the inventions entered for competition and upon the results of the apparatus, contrivances and machines. Competitors are to file their application and deliver their machines, apparatus and whatever appertains to their invention not later than six o'clock P.M. on September 15, 1902, to the office of the secretary of the committee, care of the administrative committee of the First International Exhibition of Modern Decorative Art in the buildings of the Chamber of Commerce and Art, 28 Via Ospedale, Turin, Italy.

### AN AMERICAN MODEL CITY.

The *Galveston News*, Mr. B. Gillette writes:—Through the proposed model city to be exhibited by Mr. A. Kelsey at St. Louis during the Exposition of 1903, attention will be forcibly called to the possibility of building modern cities upon vastly improved lines to those which have been heretofore in vogue. Centuries past man, with his apelike propensity, has been building cities without any possible suggestion of a plan,

cumbering the earth with vast aggregations of shops and dwellings thrown together at random, as the exigencies of the situation demanded. It now seems to have occurred to at least one individual that it is time to call a halt to this methodless action, and to draft plans for a city before building it as men have been doing for ages past. The subject is one well worthy of attention by the forthcoming convention of architects, which will be held next year at St. Louis, according to the present plans. Jules Verne recently remarked that all the things he had dreamed a quarter of a century ago had been realised by scientists of the twentieth century. In like manner the apparently extravagant imaginative ideas of the poet and novelist have been realised over and over again. The "aerial navies grappling in the central blue," "the parliament of men—the federation of the world," and other projections of the immortal author of "Locksley Hall" now are all on the point of being realised. Bellamy, in his "Looking Backward," does not formulate any definite plan for building a city, but in "The Story of the Millennium," by Arthur Field, a plan is given by means of which the ideal city may be built. This plan consists of streets formed of moving platforms in the shape of ellipses, the ends of which rotate from a common centre, where the public hall and a universal emporium is situated, all supplies being carried by means of pneumatic tubes to the houses, and all refuse expelled in the same manner. Such luxuries as electrical hurricanes for cleaning the houses, ozone zephyrs and telepathic news waves are, of course, quite a few years ahead, as is also the millennium, but the idea suggests a radical change in the scheme of housing the future populations of the earth, which may be either embodied or suggested in Mr. Kelsey's model city. The novel lines which are selected by Mr. Kelsey for innovation will deal more with the grouping of the buildings of a city with regard to the convenience of the public than with radical changes suggestive of improvements based upon a wider grasp of future needs. So far as these will go there will be much improvement of the regular kind demonstrated. In the first place there is to be an official centre, in which each building will contribute to general unity and utility. Police, fire and hospital buildings are all to be contiguous, as their relations to each other naturally suggest, and there is a hint given that this idea of grouping will be carried out in ways that will mean the centralisation of the forces of municipal life in a way not hitherto dreamed of. There is also to be a grouping of all the intellectual utilities, meaning the formation of a centre for

schools, town library, museum, lecture hall, art and technical schools and other features of an educational character. There can be no doubt that such a grouping would be conducive to the intellectual development of the people. The atmosphere of such surroundings could not fail to tell upon the student, who would be able to find that co-ordination of enjoyment and toil from intellectual pursuits which forms the perfect mind. There will be models of the most perfect institutions in the world in the way of asylums and hospitals, complete systems of transportation, subterranean, aerial and surface. There are to be models of harbours, wharves and vessels of the most up-to-date character and of distributory systems much in advance of the pneumatic facilities now in existence.

### SCOTTISH ASSOCIATION OF MUNICIPAL ENGINEERS AND SURVEYORS.

THE first general meeting of the Scottish Association of Municipal Engineers and Surveyors was held in the City Chambers, Edinburgh, on the 14th inst. There was a large attendance, and Mr. William Dyack, Aberdeen, one of the vice-presidents of the Association, was called to the chair.

The Chairman said it was very gratifying to learn that the endeavour to promote an Association of Scottish Municipal Engineers had been attended with so much success. He had no doubt the Association would be the means of promoting a more extended knowledge of municipal work among the individual members, and it would also result in a distinct advantage to the various towns and burghs throughout Scotland and to the municipal rulers thereof.

Bailie Telfer said that in the absence of the Lord Provost it was left to Bailie Waterston and himself to tender to the members of the Association a cordial welcome to the city. An Association such as that, he said, would not only be of immense importance by way of the mutual improvement and support it gave one to another, but it must prove of immense value to the Corporations of Scotland.

Mr. A. B. McDonald, M.Inst.C.E., city engineer, Glasgow, thereafter delivered his presidential address. He began by thanking the members of the Association for their kindness in conferring on him the honour of being their first president. The necessity, he said, that impelled the constitution of an Association of Municipal Engineers and Surveyors, to whose

meetings they could all without undue effort repair, had long recognised by members of the Institution of Civil Engineers and of the Association of Municipal and Sanitary Engineers as a matter involving neither disloyalty nor and it was hoped that the movement which that day a definite form might so augment itself that its permanence be effectually secured. Every one entrusted with the expenditure of public money must be animated by anxiety that the outlay was made to the greatest advantage; this feeling was of necessity accentuated year by year by the duties of a municipal engineer were continually widening, and the more varied extent of technical resource was needed for their fulfilment. Within recent years such a change had taken place in the aspirations of local government as obliterated the old going conditions that prevailed thirty years ago. The old rule regulated by rule-of-thumb had been replaced by methods of precision, and the opportunities that occurred for the contemplation of ordinary projects had disappeared in the enlightened recognition of the ever-increasing progress of sanitary science and the improved conditions that presented every department of municipal endeavour. This advancement, of course, entailed a corresponding enlargement in the technical equipment of all municipal officers, and every one must be conscious of the urgent necessity of enlarging his knowledge of civic work, and keeping himself in touch with the most recent developments of public activity, if he was to maintain his place in the arena. To do this it was imperative that he should possess the opportunity of frequent examinations of public works in course of execution, and that he trusted no one would for a moment suppose that he had estimated the value of a thorough scientific training as a preliminary necessity. On the contrary, it had always appeared to him that no engineer could possibly over-educate himself in applied mathematics and cognate branches of exact knowledge. But it must not be forgotten that the utmost extent of acquirements in this direction only put him in the possession of tools which he had yet to learn to use, and it was in the observation of the practice made use of by experienced engineers that he alone could derive such practical instruction. The information they all could obtain could be obtained only in the interchange of ideas and a frank communication of such special knowledge as they themselves had derived in the course of practice, such information as experience had placed beyond the range of speculation and empiricism, and was yet in complete harmony with the

### AUSTRALIAN TIMBER TRADE.

DING to the "Year-Book of Australia," forest conserva-  
likely to receive more attention among Australians in  
ure than in the past. Outside Western Australia its  
ance has not been generally recognised, and even in that  
he necessity for care in depleting the sources of jarrah  
ri timber supply has too frequently become overlooked.  
present time the Commonwealth imports of timber  
exceed in value the exports, despite the valuable ship-  
representing a total of 458,864/. during 1900-1, from  
n Australia; the bulk of the oversea imports represent-  
woods not grown in any of the Australian States. Had  
ural timber resources of the Commonwealth not been so  
atically neglected in the past, the necessity for imported  
would have been less felt, there being numerous districts  
h pine and other soft timbers can be readily grown.  
there has been a continuous waste of the more valuable  
of native woods. Had the commercial value of these  
arlier recognised, it is possible that their indiscriminate  
tion would have experienced a check. In most of the  
official inquiries have led to discouraging reports of the  
g conditions and prospects of the timber resources in  
nd proved beyond all question the necessity for drastic

measures to stay the work of destruction, provide for the con-  
servation of the scanty remaining supply of timber, and arrange  
for replanting the devastated areas with young trees of suitable  
character.

In a previous review it was pointed out that for many years  
to come Northern Europe, Canada and the United States  
must remain the chief factors in the world's timber supply;  
also that, respecting the timber resources of the United States,  
Mr. Henry Gannett, chief geographer of the United States  
Geological Survey, estimates the existing supply at 1,380  
billion superficial feet, sufficient to meet the present annual  
demand for the home market and export for fifty years. He  
also estimates the annual increment by growth at over 300  
billion feet, and reckons that one-tenth, or 30 billion feet,  
consists of merchantable timber. This is a little in excess of  
the annual demand of the American sawmills; but after allow-  
ing for the amount destroyed by fire and other sources of loss,  
it is considered probable that the yearly growth does not  
balance the annual drain on the forests of the United States,  
and the prospects of a continuous supply would be more favour-  
able if the waste were reduced to a minimum, which can be  
effected only by giving increased attention to the practical  
work of forest conservation. But even then it would take  
many years to repair the evil effects of former reckless pro-  
digality. Within the next few years America will find its  
surplus timber available for export continually diminishing by  
reason of the increasing home demand, especially for paper-  
making purposes.

British forests, until within a comparatively recent period,  
furnished large supplies of oak and other hardwoods, but with  
the gradual diminution of the British forest area there has been  
a growing scarcity of these classes of timbers, accompanied by  
a corresponding advance in prices, with the result that supplies  
of hardwoods from other countries, including Australia, have  
become an urgent necessity. British softwoods have always  
been limited in quantity, and the British market has for many  
years become dependent on supplies from Northern Europe  
and America, especially the kinds, mostly pine, suitable for  
flooring, shelving and similar purposes. There is little or no  
possibility of an increased supply of British-grown timber, the  
area available for forestal purposes in the United Kingdom  
being limited.

Dr. W. Schlich, inspector-general of forests to the Govern-  
ment of India, states that, after careful investigation, he has  
arrived at the conclusion that so far as pine and other soft

# aston's

# Express

# Electric

# Lifts.

ROAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

woods are concerned, the danger of deficient supply is almost at hand. At present the great exporting countries are the United States, Canada, Scandinavia and Russia, and in each of these the signs of exhaustion have become so apparent that the work of forest conservation has become a pressing necessity. There may be no heavy falling off in the supplies as a whole during the next few years, but there will be little, if any, increase, and this, in view of the annually augmented demand, will virtually amount to a continually increasing shortage. This should prove the opportunity of the Commonwealth, with its wealth of spare land which, under scientific forest culture, would make a remunerative return, albeit the process would naturally be slow at the outset.

#### *New South Wales.*

The establishment of the New South Wales Timber Industries Association has been attended with good results in the State. The object of the organisation is defined as being the introduction of an improved method of forest administration, with a view to conserving the timber resources of the State, and making them a valuable source of revenue.

The labours of the new Association led to the State Minister for Lands convening a conference of the principal State foresters, at which recommendations were made for a larger measure of protection and care of immature timber, the imposition of a uniform royalty charge on timber obtained from the Crown estate, and for the subdivision of the State into eight forestry districts, each to be presided over by a forest officer and an assistant with local guards, whose duties were to be connected with forestry alone, and who should devote themselves to the protection of forests and the administration of the timber regulations, instead of such duties being entrusted to officials holding the dual positions of conditional purchase inspector and forester, and consequently unable to give the amount of attention required in connection with forest work.

This was followed by the reorganisation of the Forest Branch, which is to be created a separate department when the sanction of the State Parliament has been obtained.

Another step in the same direction has been taken by the State Minister for Public Works by the establishment of a branch of his department, which branch will have control of the whole of the timber supplies required for State purposes. The branch will also have the control and inspection of all timber intended for export. This will enable, apart from the question of departmental control, a considerable body of

practical information of value in future legislation obtained. Many of the New South Wales hardwoods of considerable commercial importance by reason of their size and exceptional strength. The grey iron-bark has been ascertained to possess a resisting power of 17,000 lb. per square inch, compared with that of 11,800 lbs. for English oak and 15,500 lbs. for teak. Several other kinds of New South Wales timbers have a resisting strength greater than English oak. The absence of branches for the greater part of the height of each tree enables timber of considerable length and free from knots to be obtained, the average of the trees being 100 feet, with girth of corresponding dimensions.

Although attention has repeatedly been directed to the beautiful nature and industrial value of many of the New South Wales softwoods, they remain less widely known than they should be. These timbers are found mostly in the forests of the State, and several of the least known kinds are wood beautifully marked and grained, and capable of taking a high polish. Not a few have a fragrant perfume. Some of these woods are admirably adapted for the finer and artistic kinds of cabinet work. Among the leading varieties are the red cedar, which is often found growing to an immense size, as much as 2,500 cubic feet being obtained from a single tree. Other kinds deserving mention are the white pine, white beech, myall, tulipwood, rosewood, yellow wood, red wood, mock orange, red bean, black bean, silky oak, coach oak, &c. "Besides their use for cabinet-making," says the New South Wales Government Statistician, "many of the timbers are of great utility for the rougher kinds of carpentry, while some, both hard and soft woods, are admirably adapted for coach-builders and coopers' work. The chief descriptive pine growing in New South Wales is the Moreton Bay pine, found in the coast districts as far south as the Bell River. It is soft, light and easily wrought, and suitable for interior woodwork of houses, as well as for cabinet-making. The red or black pine is extensively distributed over the Liverpool Plains, and in the Lachland and Darling river districts, as well as around Berrima. It is beautifully marked, the grain, takes a fine polish, and has an agreeable fragrance. Australian deal is an excellent timber, and is obtained in large scantling, the tree frequently reaching 120 feet in height. It is soft, close-grained, easily wrought and remarkable for its freedom from knots. Its use, therefore, is extensive for cabinet-making and fittings."

*Queensland.*

Queensland the importance of timber conservation has recognised in a practical manner by the establishment of a timber branch in connection with the State Lands Department which commenced operations in August 1900. In his report dated February 12, 1901, the inspector stated that the total area of timber reserves in the State at the close of 1900 was 427,838,080 acres, a small proportion of the 427,838,080 acres reserved for the area of the State. The reserved area was subsequently increased to 1,871,974 acres, and a further reserve of 1,871,974 acres has been recommended. The chief reservation is in the Nanango and Bundaberg districts, where large areas of hoop pine and hardwood have been protected by wire fencing. It may appear that the reservation of large areas of land will interfere with selection, but most of the land reserved is of a rough country, of little value for selection, and in the country within the area reserved is found to be suitable for selection there will be no objection to its being surveyed and reserved, provided it does not interfere with valuable timber, and leaves sufficient grass and water for the use of stock-keepers who may hereafter work timber purchased off the reserve.

Efforts have been made from time to time to direct attention to the lesser known Queensland timbers, several of which are of a choice character, but in consequence of the lack of knowledge on the part of the timber-getters are ruthlessly cut down for the commonest purposes. Thus, in the Bundaberg district a valuable timber, a so-called rosewood, of considerable utility, by reason of the beauty of its colouring, for cabinet-making purposes, is largely used for building farmers' homesteads. A kind of forest oak, found at Laidley, is very red and shows beautiful markings. A specimen has been cut and polished presents a unique appearance. Common yellow wood is much used for building purposes, and white ant will not touch it. It is also used by carriage makers. Among the lesser known timber trees is the cockspur (Cudrania Javanensis), the wood of which is a rich dark colour. It would be much appreciated by cabinet-makers, for its extremely fine grain, and taking a high polish. Another timber is the common Eleaodendron Australe, which is pinkish or flesh-coloured wood, with a close grain, and takes a high polish. The ordinary Australian timbers are plentiful, but their industrial value seems to be very imperfectly understood. The black brigalow, for instance, should have a

good sale among cabinet and picture-frame makers, as it splits well, takes a fine polish, and when old closely resembles ebony.

The sawmill industry is represented by 160 mills, an increase of thirteen on the previous year, with an engine plant of 3,700 horse-power, machinery and plant valued at 239,349*l.*, land and premises valued at 146,450*l.*, and raw material in stock valued at 62,696*l.* The number of hands employed is 2,228, with 1,986 horses and 6,250 bullocks. The value of the rough timber purchased during the year was 305,740*l.*, producing 99,843,896 feet of marketable timber, valued at 511,357*l.* During the previous year the value of the rough timber purchased was 269,538*l.*, producing 90,520,076 feet of marketable timber of the estimated value of 452,524*l.*, an increase of 96,101*l.* on the value of the timber produced in 1898-99.

*South Australia.*

Rabbits and grasshoppers appear to be the great enemies of forest conservation in South Australia. According to the latest report of the South Australian Department of Woods and Forests, a loss of 58 per cent. of young trees at one of the leading forest reserves was occasioned by grasshoppers, while in others the rabbits, occasionally assisted by the insects, have been equally destructive. Most of the reserves have to be protected by wire fencing, which adds considerably to the cost of working the department. The total area of reserved forest lands in the State on June 30, 1901, was 203,114 acres, of which 13,339 acres were enclosed and being systematically replanted, the number of trees alive at the various reserves being 49,219. This is not a great achievement for a State possessing an area of 380,070 square miles, or, with the Northern Territory, 903,690 square miles, but it is better than nothing. The South Australian Conservator of Forests is apparently anxious to secure a fresh reserve of about 10,000 acres on the river Murray.

*Tasmania.*

Tasmania is essentially a fine timber-growing country, yet comparatively little has been done in the way of properly utilising its forest resources. About 4,000,000 acres, or one-fourth of the entire land surface of the State, is roughly estimated to be covered with timber forest, but of all this only 55,300 acres have been reserved by the State for timber-planting and growing purposes, consequently the work of forest conservation is yet in its infancy. Recently, however, the question of forest conservation has received considerable

# DURESCO

## THE IMPROVED WATER PAINT.

For the Treatment of Walls and Ceilings, either for Plain Work or Artistic Decoration.

Dries Flat and is not Absorbent like Common Distemper.

BOOK OF 28 DESIGNS, by W. J. PEARCE, PRICE 2/6, POST PAID,

## ETRIFYING LIQUID,

### THE STONE PRESERVATIVE.

Material has now been extensively used for over Sixteen Years for Arresting Decay in Porous Stone and Brick Buildings, Monuments, &c.

attention, and it is not unlikely that something will be done in the near future by the Department of Land and Surveys to secure a practical application, on an extended scale, of the principles of State forestry. In the annual report of the department it is stated the superior quality of the Tasmanian hardwoods, notably the blue gum and stringy bark, continues to be steadily recognised in the English and foreign markets, and will assuredly command greater attention as its strength, durability and worth for heavy constructive works, such as bridges, docks, breakwaters, railway sleepers, &c., become better known. The enormous growth and rich beds within comparatively easy access to shipping along the D'Entrecasteaux channel, are probably unrivalled in the world, and yet there has been hitherto a lack of the capital necessary for the solid and vigorous development of the industry upon a comprehensive scale. Allusion is also made to a paper read before the Royal Society of Tasmania, in which the writer, Mr. Heyn, a timber expert, representing the Dover Dock Works in England, said:—"You have in your forests a tree which combines the desiderata we require for our piling purposes—length, dimensions, solidity and high specific gravity, and less liability to attack by the terrida, in numbers sufficient for our wants for many years to come, and in situation near enough to the sea to allow of its being loaded on ships without too heavy a transport cost. This timber," continued Mr. Heyn, "is commonly called blue gum, and for size, strength and durability it would be difficult, in my opinion, to find any wood superior to it. The enormous size and height to which these giants of the bush grow enable us to hew out of them piles of 100 feet in length and 20 inches squared parallel from top to bottom. To do this, however, we require a tree 15 to 30 feet in girth 5 feet from the ground, and about 150 feet to the first branch. We found trees of the length and dimensions in Norfolk Bay, and also at Port Esperance, where there are at present several hundred logs lying ready to be sent off in the ships now on their way to load them."

In addition to the blue gum and stringy bark, Tasmania possesses an immense wealth of other timber trees, including the swamp gum, peppermint, blackwood, red pine, myrtle, King William pine, celery-top pine, and Huon pine, although the latter is said to be fast disappearing under the hands of timber cutters. A considerable area of virgin forest has been leased to a couple of English companies, subject to regulations with a view to conserving young trees and replanting where

necessary, and it is not improbable that a State nursery established in the near future.

#### Victoria.

The long-continued reckless waste of growing timber in Victoria, followed by the comparative scarcity of the valuable kinds of wood, have been fully described in a series of interesting and instructive reports by the Victorian Commission on State Forests, from which copious evidence has been given in previous reviews. The Commission has recently followed up its investigations by a report in which the questions of forestry, legislation, management and control are treated. The inquiries of the Commission began in June 1897. In the introductory remarks the commissioners state that, with the exception of those of Australia and New Zealand, the Australasian forests worked under laws primarily designed for the alienation and settlement of Crown lands, and the European policy of conservation has been lost sight of. Estimating the forest area of the Commonwealth at 184,557,000 acres, of which 11,797,000 acres are in Victoria, the Commission points out both the necessity for, and the enormous advantages derivable from, a proper system of timber conservation, and recommends the establishment of a forest conservancy board, which should consist of three persons, who should receive a moderate honorarium for their services, and hold office for a term of three years from the date of appointment, but be eligible for reappointment for a further term. In making these recommendations we need scarcely say that great care should be exercised in view of the important interests which it is proposed to place under their control. Their primary duties being in connection with the reserves, it is certainly advisable that men who possess practical knowledge of our indigenous timbers, with their habits of growth and reproduction, and of the configuration and distribution of the reserves and Crown lands generally, should be selected. The board should be responsible to the State Parliament for matters of general policy and administration, for the control of the staff, including appointments and removals, for all royalties, charges and fees (after approval by the Governor in Council), for timber, forest products, grazing and other purposes, for the collection of all revenue and the economical disbursement of all necessary expenditure, for the regulation of the distribution of trees from the public nurseries and the replanting of denuded areas, or their closure, to secure the reproduction thereon.

# ARMOURED FIRE DOORS

Telephone,  
No. 143 Westminster.

Telegrams,  
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

## STEAM HEATING INSTALLATIONS. HIGH AND LOW PRESSURE. VACUUM SYSTEM.

Water Softening and Purification.

Feed Water Filters

GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.

MATHER & PLATT, LTD. (into which is merged DOWSON, TAYLOR & CO.)

Park Works, Manchester; and 14 Victoria Street, London, S.W.

# The Architect.

## THE WEEK.

A commotion about the danger of conflagrations in buildings has overcome official equanimity and is felt in museums and picture galleries. In the report of the trustees of the National Portrait Gallery, which has just been issued, the public are assured that a thorough survey of the Gallery was made in September 1901 by Commander WELLS, chief officer of the Metropolitan Fire Brigade, who expressed himself, in his report to H.M. Office of Works, as thoroughly satisfied with the precautions against fire which have been adopted both within and without the building. Commander WELLS states:—"There is apparently no external risk to these premises. The external protection I consider, very satisfactory. The Gallery is in direct telephonic communication with the Scotland Yard fire station, and under usual conditions not more than two or three minutes should elapse between the call being received at the station and the arrival of the fire-brigade. The water supply is quite satisfactory, having the same water system as the National Gallery adjoining. Every precaution appears to be taken for the prevention of a fire breaking out, and so far as I can gather a good system of fire control is kept." Several important suggestions for the improvement of the internal arrangements, made by Commander WELLS, have since been carried out by the Office of Works. The Trustees say they are gratified to be able to report to the Treasury their entire satisfaction with the arrangements thus made to protect the National Portrait Gallery and its contents from any possible outbreak of fire.

THE town of Altenberg, which is near Cologne, possesses a Cistercian abbey which, according to SCHIMMEL, presents the same system of design that has been admired in the cathedral of Cologne. The severity of Cistercian treatment could not be overcome even in Germany, where at all times, owing to the plenitude of carvers, there was a tendency towards redundancy of ornamentation. The building was commenced in 1255, and the beautiful choir was completed in the course of ten years. The church was consecrated until 1379; it therefore occupied a century and a quarter in erection. The building, like so many others in Germany, has its special Verein or society which is organised for preserving it in good repair. The annual meeting was held a week ago. It was reported that several important works had been undertaken, and especially the restoration of some of the windows in which the original details are exactly copied. It is intended to have an organ gallery and new choir stalls, but for the latter a model is to be placed in the building in order that the appearance may be judged. Most of the money for the work is raised by means of lotteries. To the end of May nearly 6,000*l.* was obtained in the present year. There is no decline of interest in the building, which is now accepted as a cathedral, and it is anticipated that within a measurable time the ancient church will be restored as far as is needed.

IN Düsseldorf the production of works of art attains so much importance, it can be regarded as the staple industry of the place. It is true a large amount of coal and iron is obtained, but that class of labour does not impress the popular imagination. The death of FRIEDRICH SCHAAFSCHMIDT, the conservator of the collections in the Royal Academy of Art, is therefore more of a loss than would be the case if any other high official had passed away from Düsseldorf. He had occupied the post during so many years, he had attained an almost encyclopædic knowledge, and was competent to answer the inquiries of artists on subjects however remotely connected with any division of art. He had prepared himself for the office almost from boyhood. He studied art not only in theory but in practice while in Italy, and with so much success he was appointed in his nineteenth year to the office previously held by Professor LEVIN. As became a German, he was occupied for a large number of years on a great work on the history of art in Düsseldorf, and especially describing the aid of the art unions of the Rhineland and Westphalia. Those institutions do not correspond with

the British art unions, for while with us they are restricted to the issuing of engravings and the purchase of paintings for the benefit of the subscribers alone, in Germany there is more disinterestedness, for the funds obtained are often devoted to large mural paintings which will benefit the community in general. Yet there is no country in Europe in which help of the kind is so much needed as in England. We have a great many new municipal buildings, but the corporations dare not employ the public funds on an embellishment of the walls. In a German town rival unions or guilds compete for the privilege of covering the empty spaces in a building with paintings that will commemorate the private history of the place. FRIEDRICH SCHAAFSCHMIDT'S work might therefore with advantage be translated for the assistance of Englishmen.

THE Municipal Council of Paris have concluded their arrangements for the purchase of works of art from the two Salons. As a rule a sum of 3,000*l.* is expended annually. This year it has been necessary to reserve out of that sum 600*l.* for engraving two important pictures by M. EDOUARD DETAILLE, which are destined for the Hôtel de Ville. As yet no complete list of the purchases has appeared. It is anticipated that disputes would arise over the selection of some of the works, and those who are responsible for the choice wish the debates to be deferred in the hope that time will bring more unanimity. Three thousand pounds may not seem a munificent outlay for pictures, statues and examples of art applied to industry; but the artists find it is an advantage to have their works selected, and endeavour to meet the municipal purchasers by a reduction of terms.

METALLIC construction appears to have had not the least power of resistance during the volcanic eruption at St. Pierre. Not only was it incapable of withstanding the weight of the burning matter, but some chemical action is likely to have taken place which transformed the particles. M. AMEDÉE KNIGHT, a senator of Martinique, was on the island at the time of the disaster, and he has been able to furnish details about the destruction which were not observed by others. He describes the effects shortly as corresponding with those which might be expected if some colossal Nasmyth's hammer had been employed in operation on the town. Most things have been reduced to a fine powder. One of the cases mentioned is the market of St. Pierre. After the cyclone of 1891 the authorities decided to reconstruct it in the most solid manner. Cast-iron was adopted. It is now impossible to find the slightest trace of construction which had an area of 2,000 metres square.

MESSRS. MATHER & PLATT, LTD., who have had a long experience in the manufacture of automatic sprinklers, have given the following particulars in reply to some criticisms on those appliances:—"A sprinkler installation is not an expensive fire-extinguishing appliance to install, provided adequate water supplies can be obtained. Further, a discount is granted by the insurance companies, varying with the class of risk from 20 to 40 per cent. when automatic sprinklers are fitted in a building, thus showing a good return on the outlay expended on the equipment. Sprinklers are not fixed in one particular room, but on every ceiling and in every cupboard and corner of a building—in fact, wherever a fire can occur there is a sprinkler ready to cope with it. Thus, though fixed and immobile they are always ready like a watchman night or day to deal with a fire in its infancy. From a practical point of view sprinklers are of more use than movable appliances, inasmuch as they are automatic, and operate and extinguish a fire without human agency before it has had time to become dangerous. This is proved by the fact that the insurance companies allow a minimum discount in their premiums of 20 per cent. for automatic sprinklers, whereas the maximum discount allowed for any system of non-automatic appliance is but 15 per cent." It seems extraordinary that so efficient an aid in the suppression of a fire is not universally adopted. As Messrs. MATHER & PLATT have pointed out, they have advantages of their own which have been repeatedly tested. Automatic as well as movable appliances ought to be found in all buildings in which the outbreak of a fire is likely to be followed by loss of life.

## ROYALTY AND ART.

IN England the majority of our kings were generally engaged in enterprises which allowed little time to be devoted to the arts. The artists, therefore, rarely attained royal favour. In the thirteenth century HENRY III. sent a mandate to the sheriff of Hampshire to the effect that a chamber in the castle of Winchester should be repainted, the pictures being identical with those which had existed there. From the order we can infer that in those days artists were of no greater importance than ordinary craftsmen. There is a recognition of an artist or master of works by the monarch, for EDWARD of Westminster was instructed to have the statues of the Apostles painted around the chapel of St. Stephen. We also hear of a command to FITZ-ODO to make a "dragon, in manner of a standard ensign, of red samite, to be embroidered with gold, and his tongue to appear as though continually moving, and his eyes of sapphire, or other stones agreeable to him, to be placed in this church [Westminster] against the king's coming hither." HENRY had the history of one of the Crusades painted, both in the Tower of London and in a chamber at Westminster known as the King's Jewry. The king appears to have been a lover of art, but he made little or no distinction between the artists. It is sometimes asserted that the money which he was said to have lavished on unworthy courtiers was in reality expended on works of art.

No artist ever attained more power than WILLIAM PEROT of Wykeham. The words of LELAND merit to be repeated:—

Edwarde the Third cummyng to Winchester Castelle lykid Perot and tookē him to service, and understanding that Perot had mind to be a preste, made him first parson of St. Martines, in London; then Archdeacon of Buckingham. Edwarde afterwards made him Surveyor of his buildings at Windsor and Queenburge in Kent and other places. Then he made him Bearer of the Privy Seal and Master of the Wards and the Forests. Then he made him Bishop of Winchester, Chancellor and Treasurer of England, as very manifestly appeareth by writing. The Black Prince scant favoured Wikam. Wikam procured to keep the prince in battle out of the realme. John of Gaunt, Duke of Lancaster, enemy to Wikam. Alice Perrers, concubine to Edwarde the Third, caused Wikam to be banished, and then he dwelled in Normandy and Picardy a seven years, Edwarde the Third yet lyving. Wikam restored about the second yere of Richard the Second, of whom he had a generale pardon.

In this extract we have a synopsis of the history of Court favour. The bishop rose and fell. Everything, writes FROISSART, was done by him, and nothing was done without him. But WYKEHAM must have known how precarious was his position. The martial vigour of EDWARD III. sank into dotage, and WYKEHAM found himself in a difficult position. The Duke of LANCASTER obtained sufficient power to have WYKEHAM banished twenty miles from Court, and in the Jubilee which celebrated the fiftieth year of EDWARD's reign it was announced "that Sir WYKEHAM, Bishop of Winchester, shall nothing enjoy of the graces, grants and pardons, nor in nowise be comprised within the same." In spite of all the plots of his enemies, WILLIAM OF WYKEHAM was enabled to reach his eightieth year, and to establish institutions which to this day bring advantages to the English people. The extent of his skill as an artist cannot be determined. Some investigators have believed that the Perpendicular variation of Gothic was due to his inspiration. He may have been simply a great administrator, and bore more analogy to the head of a contracting firm than to a modern architect; but he was recognised as an artist, and his career was the most remarkable of any in this country.

Another monarch who is recorded as being the slave of his favourites was RICHARD II., who, however, was friendly to the bishop. The portraits of the king suggest that able artists must have existed in England during his reign, but no mention of their names has descended to us. Both painting and sculpture were not entirely neglected under succeeding monarchs, but when we find in the time of HENRY VI. that one of the English nobles obtained the examples of painting which were to be employed during his embassy in France through his tailor, we cannot conclude that artists were highly valued. HENRY VI. was married

to the daughter of King RENÉ the Good, who was a painter as well as a poet; but the queen did not apparently exercise any artistic influence in England.

It must accordingly have been a great surprise to noble and gentlemen when HENRY VIII. declared it would be easier for him to create several lords than one HOLBEIN. As a similar saying is attributed to foreign kings, it is not possible to ascertain where it originated. CHARLES V. and FRANCIS I. were friendly to artists as well as liberal in chasing their works. King HARRY was always vieing with them. He was therefore obliged to assume a taste even when he were not endowed with one by nature. He did his utmost to allure RAPHAEL and TITIAN to England, but without success. There are records of several painters, among them were ANTONIO TOTO and LUCCA PINN TORREGIANO, the sculptor, might have succeeded beyond his predecessors if he cared to remain in England, but he was of too wayward a disposition to stay in one place. HOLBEIN was more easily acclimatised. He was recommended to Sir THOMAS MORE, and had been living with him for some time before his works were seen by the king. HENRY was delighted with the portraits, and at once took the painter into his service. HOLBEIN was not possessed of much imagination; he would now be called a realist, and his love of detail was carried to a marvellous extent. The eighty-nine drawings of courtiers convince us of their truth, and the character of CHARLES I. as an amateur would have gained if he had not bartered them for the *St. George of RAPHAEL*. There are few indications of the relations between the Bluff King and the painter. HENRY at times could not control himself, and then it was dangerous to be near him. It is commonly told that THOMAS CROMWELL was beheaded because HOLBEIN for once departed from his fidelity to appearances and idealised ANNE OF CLEVES in a drawing. But the painter did not suffer, and when he died in London in 1554 the plague, and not the headsman, was the cause. The value set on his works by HENRY is shown by the fact that the king presented FRANCIS I. with one of HOLBEIN's works in return for a *Virgin and Child* of DA VINCI. He had some of the versatility of the Renaissance artists, for he practised in sculpture and architecture, and took delight in designing objects to be formed of the precious metals. He must have received a large amount of money, but he was always impecunious, and there is an entry that his salary had to be paid in advance. His expenditure no doubt was based on that of an English courtier.

ELIZABETH seems to have cared little for art except in the form of portraits of herself. LUCAS DE HEERE painted several portraits of the queen and of other ladies. CORNELIUS KETEL was once allowed to paint a portrait of the queen, but he was better adapted to depict plebeians. It became known that he could dispense with brushes and painted solely with his fingers; that was enough in those days to gain notoriety and success. FREDERICK ZUCCHERO pleased ELIZABETH and is said to have depicted her in a Persian dress amidst a forest, and on one of the trees were several verses which it is presumed were Her Majesty's composition. MARC GARRARD was another Court painter, and the queen sat often to RICHARD HILLIARD, who was limner, jeweller and goldsmith. In fact, the crowd of painters in London during ELIZABETH's reign would suggest that the queen must have been a good patroness of art. It is doubtful whether the queen's portraits were not executed on reduced terms as advertisements. WALPOLE probably stated the case exactly when he wrote:—"It is certain, though the queen's economy or want of taste restrained her from affording great encouragement to genius, that the riches and flourishing condition of the country offered sufficient invitations to the artist."

JAMES I. was in a peculiar position when he came to England. Under favourable circumstances he would have made a place for himself among the seventeenth-century scholars, and he cared more for books than for pictures. He was not, however, altogether indifferent to painting. BUCKINGHAM, his favourite, loved pictures and patronised RUBENS. The arrival of INIGO JONES during this reign is ample evidence that there were favourable prospects for artists, while the devotion to collecting of Lords ARUNDEL and PEMBROKE indicated a rising interest in the works of antiquity. DANIEL MYTENS, as well as CORNELIUS JANSEN and others, seem to have been employed by the king.

BUCKINGHAM exerted his influence on Prince CHARLES, and instilled in him an admiration for painting. The inclination of the king was imitated by many of the nobles and other subjects. The Duke of BUCKINGHAM succeeded in obtaining RUBENS's own collection, and besides favourite works of the Flemish painter there were nineteen by TITIAN, thirteen by PAUL VERONESE, seventeen by TINTORET, three by LEONARDO DA VINCI, and three by RAPHAEL. The pictures acquired by CHARLES numbered 460, including nine by RAPHAEL, seven by TINTORET, eleven by CORREGGIO, four by VERONESE, and two by LEONARDO. Both CHARLES and BUCKINGHAM endeavoured to attract foreign painters to London. RUBENS came as representative of the Infanta of Spain, and at the desire of the king he displayed his talent by painting the apotheosis of King JAMES for the banqueting house at Whitehall. The year which the artist spent in this country was not without its effects on English art. VANDYKE followed; at first his powers were not recognised, and he departed in disgust. Then CHARLES sent for him, and he was at once the favourite painter of the king and Court. CHARLES was not sufficiently sincere to rule Englishmen, but there is no doubt that if he had been permitted to remain on the throne art would have become a necessity in the country. When Puritanism gained the upper hand vengeance was wreaked on CHARLES's pictures as if they were among the causes of his misgovernment. By a resolution of the House of Commons it was decreed that all the king's religious pictures were to be burnt, and all such pictures and statues as were without any superstition should forthwith be sold for the benefit of Ireland and the North. Fortunately the orders were not promptly carried out. The sales were held from time to time during seven or eight years, and produced 38,000*l.* The cartoons of RAPHAEL were secured by CROMWELL for 300*l.*; the *Mercury Teaching Cupid*, by CORREGGIO, which is now in the National Gallery, obtained 800*l.*, and MANTEGNA's *Triumph of Julius Caesar*, which is at Hampton Court, 1,000*l.* Several canvases in the Louvre once belonged to CHARLES I., and the majority of the Duke of BUCKINGHAM's collection fell into foreign hands. All hopes of art appeared to pass from England with the masterpieces.

The ideas of CHARLES II. about art and artists were more French than English. The king and his associates were supposed to be the most fitting subjects for a painter's pencil. If a higher class of character were desired, the favourites of the king were ready to pose as saints or heroes. To other eyes besides PEPYS one of them then made "a most blessed picture," and the honest Admiralty official probably would not have objected to see such works from his pew in church. Other painters toiled over acres of allegories which were only another aspect of the endeavour to go beyond nature, for abstractions took the place of saints and nymphs. The number of painters who were able to live in England under CHARLES II. was surprisingly large, and at least they helped to extend the employment of portraits. We have a tradition of that age in the big group which represented the Vicar of Wakefield's family, in which Mrs. PRIMROSE was seen as VENUS, her little boys as Cupids, one daughter as an Amazon and another as a shepherdess attending as many sheep as the painter could introduce without payment. It was accepted by high and low that art was to be remote from actuality.

To that spirit, however, we are indebted for one noble work. WREN, when he was asked to make designs for St. Paul's, avoided adopting any of the existing churches in England as a model. There were several designs from his hand, and the king declared he pitched upon one because he found it "very artificial, proper and useful." It was as much a departure from precedents as the portraits of the Court ladies in character. WREN was actuated by the expansiveness of the time, but in his case there could be no comparison with natural objects. Architecture is not to be judged by created forms. The mansion at Winchester would, if completed according to the architect's intentions, have surpassed anything of the kind in England. WREN had the unique experience of being on friendly terms with CHARLES II., JAMES II., WILLIAM and MARY and Queen ANNE. He, however, was made to suffer under the new or administrative power, which embittered the last years of his life and attempted to deprive him of his modest salary.

None could credit this, says a contemporary writer in referring to WREN's treatment, "but those who knew how the demop of politics, like that of fate, confounds all distinctions—how it elevates blockheads and depresses men of talents, how it tears from the mouth of genius, exhausted with toil for the public good, and bending under a load of helpless age for which it has made no provision, that bread which it bestows upon the idle and the selfish."

It has often been regretted that under GEORGE I. art enjoyed but scant favour from the Court. That was not entirely a disadvantage. In England the same course of events took place in respect of art which was afterwards witnessed in Germany. SCHILLER maintained it was a blessing for the German muse when she was repulsed from the throne, for then she turned to the people and assimilated herself to them. The art of England also sought to become popular. HOGARTH tells us that he was incited to abandon engraving by thinking over the big paintings in St. Paul's and Greenwich Hospital. In other words, he was ambitious to be a representative of high art which, in England at least, was associated with Courts. Even to the last, although Sir JAMES THORNHILL had opposed the marriage of his daughter to HOGARTH, the son-in-law was always among his admirers. HOGARTH's shrewdness soon realised that his mission was to hold the mirror up to nature, and his best patrons were the public. He speaks of the benefit which Parliament had conferred on artists by passing a Copyright Act in language which seemed to be drawn from the eulogies usually bestowed on sovereigns. By that Act he said genius and industry were prompted by the most noble and generous inducements to exert themselves; emulation was excited, ornamental compositions were better understood, and every manufacture where fancy has any concern was gradually raised to a pitch of perfection before unknown. The old reverence of artists for royalty is manifested by the obelisk of the church of St. George, Bloomsbury, with the statue of GEORGE I. on top. We must bear in mind, however, that HAWKESMOOR, the designer of it, was clerk of works for the royal palaces. GIBBS, COLIN CAMPBELL and other architects kept themselves independent of the Court. Sir WILLIAM CHAMBERS in the next reign gave lessons in architecture to the young prince who was afterwards GEORGE III., and in that way his professional success was prepared. But on the other hand, we find HOGARTH dedicating his *March to Finchley* to the King of PRUSSIA. REYNOLDS, although dedicating his discourses to King GEORGE III., of whom he spoke in terms of gratitude, declined for some time from taking part in the establishment of the Royal Academy, although it was the king's, and only joined when his objections were removed. WEST succeeded in gaining the favour of His Majesty, and for a long time he was able to count on royal commissions every year. He painted historical and scriptural scenes for GEORGE III., besides portraits of the king, queen, princes and princesses. Posterity has not endorsed the king's estimate of the painter's excellence, and by having always one judge in his thoughts he fell into a mannerism through which his art did not benefit. Since his time several painters have obtained royal commissions, but WEST was the last who enjoyed extraordinary favours, and owing to the changes in life it is probable he will long remain as the representative of a custom that was more common abroad than in England.

**Stepney Parish Church**, which was damaged by fire last year, was reopened on the 21st inst. It was in the middle of last October that a disastrous fire occurred at the church, and it has taken six months' work to make good the damage. Practically the whole of the roof was destroyed, only the chancel arch, two main beams in the chancel itself, and a few rafters at the west end of the nave remaining. Solid English oak has been used for the new roof. A new altar replaces the old one. Two-thirds of the east window is new, and the south chancel and north aisle windows and one of the windows in the clerestory are also new. The organ was entirely destroyed, but the new one, which is on order, will not be in position till next October. Of the vestry only the walls were left standing, and the stonework of the windows, the roof and the interior fittings have all had to be renewed. Opportunity has been taken to put in electric-light fittings, but these will not be in use till autumn. Altogether about 6,500*l.* has been spent in the work of restoration.

## JOSEPH JOUBERT ON ART.

IF there is truth in what SHAKESPEARE says about nature being a usurer and insisting on profit from the smallest scruple of excellence with which a man is endowed—"For if our virtues did not go forth of us, 'twere all alike as if we had them not"—then it must go hard with some of the best men who lived in this world. They considered the improvement of their own minds was worth their whole attention. They avoided doing anything which would gain the applause of contemporaries, and were indifferent to posterity. SHAKESPEARE himself, or the genius who was concealed behind the actor, was forced to lament the necessity by which he was compelled to reveal, or gore, his secret thoughts for the gratification of the curiosity of the groundlings.

Scarcely a century ago another poet of even greater productiveness, the German GOETHE, also spoke in self-reproof of the danger of neglecting himself and spending his powers on the instruction and entertainment of men who were strangers to him. A like thought embittered HEINE's sufferings on his "mattress-grave."

JOSEPH JOUBERT would be condemned by those who hold that fine spirits are like torches which are not lighted for themselves, but believers in self-cultivation will always esteem him as a wise man. If he could be conscious of what is enacted in this world of ours he would be amazed that critics who are competent to give decisions on all questions of literature have prized him, and have valued the thoughts which he noted on scraps of paper for his own use as if they were axioms which were worth acceptance for general use. It is doubtful whether he ever contemplated the production of a volume. When friends who knew his worth advised him to write, his excuse was, "Not yet," for he needed a long term of peace to prepare himself for authorship. Years rolled on, and when the same question was put he replied, "The time is past; any strength I received was only of temporary duration." His experience of life might easily be thought to have provided materials which "this PLATO, with the heart of LA FONTAINE," as CHATEAUBRIAND called him, could easily have turned to account. Born in 1754 he was able, in his twenty-fourth year, to gain the friendship of DIDEROT, and to mix with the encyclopædists. But his thoughts were with antiquity rather than with the coming revolutionary era. He became an admirer of SHAKESPEARE, and maintained that, in spite of occasional expressions of rebuke, VOLTAIRE bestowed more praise on the Elizabethan dramatist than any of the Englishmen of that time. During the Revolution, he contrived to stand aloof from the turmoil. When NAPOLEON had attained power and wished to establish order, JOUBERT was appointed one of the inspectors-general of education. He was not adapted for official life, and as soon as he could he resigned his functions and returned to his beloved studies. When in 1824 he felt his end was approaching, the last words he wrote in his journal were "*Le vrai, le beau, le juste, le saint!*" which afford a key to his aspirations after what he believed to be worthiest of man. Fifteen years later some of his "pensées" were printed for the benefit of his friends, for JOUBERT was unknown to the majority of his countrymen. It must be confessed he is still a stranger to most people, but there is no doubt he is now regarded as the representative of a school which, if confined in numbers, is not lacking in quiet enthusiasm.

As we have explained, his value must be determined by a number of detached remarks which were jotted down from time to time. Writing of that kind is not appreciated in England, and we have no rivals of LA ROCHEFOUCAULD, VAUVENARGUES, PASCAL, NICOLE and others. There might have been a work which would bear comparison with the Frenchmen's if EMERSON had preserved the original form of the records of his thoughts, instead of turning them into essays and lectures by means of connections that are generally loose. But he knew the bias of the English and American mind and endeavoured to accommodate himself to it. JOUBERT'S cogitations relate to an immense variety of subjects. He might say, "I think good thoughts whilst others write good words;" and what we have are but stray specimens of his thoughts, and probably not the best among them. As an untiring student of literature the majority have more or less relation to the books he read,

the qualities of writers ancient and modern, and doctrine affecting literature, such as those of religion, philosophy, ethics, &c.

He would not be considered a true Frenchman if he avoided reflecting on art. The period in which he lived was unfavourable to the studies of a man like JOUBERT, for the art of the eighteenth century was then in its decline. DAVID, who was inspired by the revolutionary movement, tried to bring into vogue a style that was false, although as a portraitist he was faithful to nature. Under NAPOLEON the artists cared only about pleasing him, and in the new monarchical era the commonplace prevailed. JOUBERT therefore may be considered to have drawn his ideas of art from himself, or have based them on the ancient statues and spoils of Italy which were for a time in Paris.

He recognised the supremacy of architecture. According to JOUBERT, there ought to be a relation between a building and its occupants. The stones, the marble and the arrangement should, he said, be eloquent and expressive. It was easy from this to see he was a gentleman of Périgord and was thinking of provincial families who endeavoured to uphold the character of their ancestors. A soldier who carried a bâton in his knapsack might in course of time when he became a marshal, erect a château and found a family, but that would be only imitating the early feudal lords. JOUBERT did not realise the invasion of country houses by the *nouveaux-riches*, who would forget their town breeding and strive to follow the ways of the old seigneurs. If he were living now he would find that a mansion announced what was desired rather than attained.

When he said that a public edifice, and especially a temple, should be elevated and stand as it were on an altar just as a statue is placed on a pedestal, he was revealing that he was a contemporary of the construction of the Temple of Glory which is now known as the Church of the Madeleine in Paris. NAPOLEON himself selected VIGNON'S plans from amongst those in the competition and one of the reasons which determined his choice was likely to be the success with which the low Classic building was dignified by the aid of a platform no less high. NAPOLEON thought only of the effect on vigorous people. He made no account of the difficulty which maimed soldiers must undergo in ascending the steps, and JOUBERT also disregarded the sacrifice. The pedestal theory has caused an incalculable amount of suffering. Hospitals have had to be approached by a great many steps, and churches also although it was known the majority of worshippers were infirm.

We see JOUBERT'S love of regularity and of the stately in what he says about the surroundings of a building. Everything within visible distance of it should have, according to him, a similarity of character, or, in other words, the centre should be in harmony with all the points of the circumference. Much as he admired English literature, he disliked the so-called English gardens, which at the time were becoming fashionable with the French people. So much irregularity he said demanded that the habitation should be a labyrinth. In all this can be traced the influence of French logic which demanded uniformity of principle in all things, preferring it to contrast. In works of art JOUBERT insisted there should be nothing arbitrary, and one character must be manifested throughout.

Although he was supposed to be a follower of PLATO, he would not banish the arts from his ideal kingdom, whether it was a republic or a monarchy. Instead of treating them as superfluities, like the pseudo-Spartans of his time, he declared them to be among the most precious and most important property of all human society. Without their aid it would be impossible, he said, for the sublime spirits to express the greater number of their conceptions. Without them the most perfect and most just man could experience no more than a part of the pleasure of which he was susceptible, and of the happiness for which nature designed him. There are emotions so delicate and objects so ravishing which can only be expressed by colours or sounds. We should, he declares, look on the arts as a special language, a means of communication between the inhabitants of a superior sphere and ourselves.

JOUBERT considered the doctrine that imitation was the foundation of the fine arts is more correct and more extended than is generally accepted. Man portrays himself

his works, and they can be only beautiful when they have corresponding proportions. But the portraying should not be confined to what is visible, but comprise things which are concealed, such as mental qualities. The most beautiful expressions in all the arts are those which appear to have been derived from an elevated contemplation. If the intelligence is not appealed to much is lost. An artist who excites no more than sensations and considers terror to be the source of sublimity prostitutes his art, for his effects can be as well produced by the public executioner. If there is only a body in the picture or the statue, it is evident the artist is nothing higher than a workman without a soul, whose ability is confined to his hands.

The foundation of all beauty was, in his opinion, to be found within fine lines. In architecture they are allowed to be visible; in sculpture they are carefully disguised; in painting they are veiled by colours. Nature herself conceals the bones and covers them in living beings; in the skeleton there are lines, but life is seen in contours. JOUBERT says that what is known as the line of life and of beauty must be realised in judging a work of art. But it is not always possible, owing to their elusiveness, to trace them with the finger. He means to say that in most forms which are beautiful no one section is adequate, and as we live in modern times, an effort is made by rotatory photography to overcome the shortcomings which follow from viewing a single point of view.

For that reason he was a great admirer of the works of JEAN BAPTISTE PIGALLE, who died in 1785, and might therefore have been seen by JOUBERT. He was a modest artist, of whom the story is told that when he heard a criticite in front of one of his works that the ancients never created anything more beautiful, he asked him if he had closely studied antique sculpture. JOUBERT says it was a peculiarity of PIGALLE to discover an infinity of parts in every part, or, in other words, he divined that in animated forms nature was always varying, and every curve was made up of a series of curves. Consequently there is more of detail in his work than in that of the majority of sculptors. He made it a law to restrict himself to truth. It was objected to him that in depicting the passions he used more modifications and differences of surface because he believed that was the only way to suggest the action of the mind upon the body. He became amorous of an excess in expression, and endeavoured to demonstrate as far as possible the two extremes of human life, viz. when the body is vigorously animated and all parts are prominent, and as a contrast the state of excessive fatigue when the parts seem to be without union.

With all his admiration, JOUBERT admitted that PIGALLE was inferior to the ancient sculptors. When they had to represent deformity they somehow were able to suggest what was absent. In the features of their old men we can recognise their former appearance, and those who are ill and dying are reminiscent of former life and health. PIGALLE's old men might have been always old, and his figures of weaklings might have never had strength. He showed old age in an extreme form, whilst the ancients sought to make it venerable; he was a sculptor, his predecessors were poets. In his monument of Marshal SAXE, which we can see in Strasbourg, the Warrior is a brave man in armour, who boldly marches towards the tomb. But to recall the living MAURICE he introduced a figure of HERCULES in mourning and a terrified woman as a symbol of France. JOUBERT did not approve of the composition, but the majority of visitors are pleased with the dramatic effect. Perhaps the severest criticism of the sculptor will be found in JOUBERT's words, that not one of his figures adapted to be placed in a school of art as a model. Possibly PIGALLE's monumental sculpture lessened his value in JOUBERT's eyes, for he could not be patient in front of the allegories, the figures of skeletons, the hour-glasses and the scythes which at that time were to be met with, as if affection and grief could only be expressed by their aid. In many respects he preferred BOUCHARDON to PIGALLE.

In painting his idol was RAPHAEL, but he insisted on the character of the subjects as an element of the painter's success. RUBENS, he says, was a *très-grand dessinateur*, but was incapable of showing Flemish forms by means of the pure line of the Roman master who avoided

common nature. Artists, he stated, when painting the moral nature should avoid exaggeration, and in physical nature they should be afraid of feebleness. He admired REMBRANDT for the skill with which he has infused interest into common subjects. He compared him with RUBENS: one is able to reign by the power of colour, the other by light; one could make everything striking, the other could illuminate all things; one is splendid, the other is magical, and if the mind is not always charmed by them the eye owes its most brilliant illusions to the two artists.

In estimating the character of a writer it is always an advantage to be acquainted with him. Although philosophers may imagine the mind to be independent of the body, there is no doubt that the condition of human organs seriously affects the views taken of life. Mr. PICKWICK's solicitor was very anxious to ascertain what kind of breakfast had been enjoyed by the foreman of the jury on the memorable day when Mrs. BARDELL's action was to be tried; a meal in which pork chops formed a disproportionate element was sure to make him use his influence against the defendant. What strange volumes owe their existence to Mr. CARLYLE's dyspepsia. JOUBERT, like most literary students, believed his organism to be deranged. CHATEAUBRIAND tells us the constant endeavour of his friend was to avoid emotions, because he feared they would upset his delicate health, and by a strange fatality he was always in a state of excitement about the joys and sorrows of his friends, never about his own. For hours he remained with eyes closed and without speaking, in the hope of regaining the desired calm. It is not difficult to understand how such a valetudinarian would prize repose in the arts. The leonine strength and exuberant animation of RUBENS must have inspired him with fear, for if one of those boisterous figures were to come down from the canvas and seize hold of him he dare not resist, and it would be fatal to fly. He may also have imagined before REMBRANDT's pictures the extent of his torment if he were made the subject of experiments in lighting by means of a reflector. RAPHAEL's gentle MADONNAS always suited his moods, and out of gratitude he praised them with all his heart. Representations of weakness or old age recalled his own condition with all its imaginative failings, and his thoughts therefore went back to the Greeks, whose works can always be made suggestive of perennial youth, vigour and beauty.

#### BEAUTIFYING LEEDS.

MR. G. J. FRAMPTON, R.A., the sculptor, visited Leeds last week, with a view to select a site in Victoria Square for the Queen Victoria Memorial, which he has been commissioned to execute. In conversation with a representative of the *Leeds and Yorkshire Mercury*, he explained what he intended to do in this respect, and also what he should like to see done.

In the first place, he regarded the town hall, which he had not previously seen, as one of the finest buildings in the kingdom, and he felt proud to be called upon to execute work in connection with it. The memorial he has in hand is to take the form of a bronze statue—bronze constituting the best material for withstanding the smoke of a commercial city—but whether the figure is to be a standing or sitting one is not yet decided. In any case, it will be about twice life-size, and with its pedestal will rise to something like the height of the buildings—or “sheds,” as Mr. Frampton termed them—to the south of the Square.

“And where do you propose to place the memorial?” “Well,” answered Mr. Frampton, “I should like to have the Square made level with the base of the town hall steps, and suggest placing the statue at the verge of the street there,” indicating Park Lane, facing down Park Cross Street.

To level the Square in the way suggested would cause it to be elevated several feet above Park Lane. The same would be the case on the Oxford Place side, where Mr. Frampton would like to see the present dangerous slope done away with—thus providing more room for carriages—and the footpath round the town hall effectually railed off. Carriages might enter and leave the Square at points near Calverley Street and East Parade.

To place such a memorial so near the shops and warehouses on the south side will inevitably tend to magnify the meanness of those buildings. Mr. Frampton is not blind to this. Rather does he rejoice in it. “Sooner or later,” said

he, "the town will realise its duty, and sweep those sheds away, extending the Square and widening that street" (Park Cross Street) "to thrice its present width."

Then it would be possible to keep the town hall in view from a distance without sight of painful architectural incongruities. Mr. Frampton had thought of placing the memorial on the landing of the town hall steps, but felt that this would be too near, and that it would darken the already dark vestibule. "I have to fight the building, you see," said Mr. Frampton, smiling. "I have to avoid getting so near to it that the memorial is lost, and I must not place it so as to suggest that it has dropped from above."

"I should like to get some colour into my memorial," continued he, "for it is colour that a town like this most lacks." And so he would make use of Ruabon brick or some kind of red marble for his pedestal—he does not care for red granite, whilst porphyry is too expensive. Green tubs containing rhododendrons or other shrubs might also be placed about the Square to enliven it and make it approximate to the Continental "Grand Place," where the people might be tempted to gather to a greater extent than they do.

Mr. Frampton is now about to make a model of the Square and memorial, which he hopes to have ready for public inspection and criticism in October or November. At present he is busily engaged upon a Victoria memorial for Southport.

Mr. Frampton is a great believer in the refining influence of art and beauty. "With so little of beauty about them," said the sculptor, "it is surprising to me that the people should conduct themselves so well." Leeds is, of course, slowly beautifying itself, and it is gratifying to have Mr. Frampton's assurance that Mr. Brock's equestrian statue of the Black Prince, which the City Square still awaits, will form one of the finest works of the kind in existence, worthy of comparison even with Verocchio's statue of Bartolomeo Colleoni at Venice. "I am only sorry," said Mr. Frampton, "that London can claim no such treasure. Leeds must be congratulated."

"Why is it no one's duty to look after the public property?" went on Mr. Frampton, indicating the grimy statues of Peel and Wellington in the Square. "A little water and a hose-pipe would have spared them this." These statues Mr. Frampton would remove, not because they are bad work—he holds the figures are good—but because they are out of keeping with each other and the Square.

Asked as to his general impression of Leeds, Mr. Frampton said he had been favourably impressed. He admired some of the banks in Park Row, and thought it rather a pity that St. Ann's Church should have to come down, as it gave a certain touch of character to the street. Bright brickwork he held to be the right thing, though he did not exactly wax enthusiastic over the new erections in Briggate. "Colour is what you want," he insisted, and as one glanced from the leaden sky to the muddy streets and soot-befouled buildings, one was only too ready to agree with him.

## RATING OF OXFORD UNIVERSITY BUILDINGS.

JUDGMENT has been given by the Hon. Alfred Lyttelton, Recorder of Oxford, in the appeals against the assessment by the city Council of ten of the colleges, a number of University buildings, Christ Church and the University Press, in the Quarter Sessions Court.

In the course of the judgment he said the case was one of great difficulty and was admittedly *sui generis*. It was impossible to rate the hereditaments in question by comparison with other similar subjects, for no similar comparable objects existed. It was equally impossible to rate them by methods analogous to those employed in the case of railways or other like undertakings by regard to the profits arising from occupation, for the University made no profits. Nor, again, was the "contractor's basis" available, for many of the buildings in question were raised out of the benefactions of pious founders, were inaccessible to the competition of the market, and some of them were used rather because they existed than because they were well adapted for University purposes—buildings, in a word, widely differing from those commercial structures with which the contractor's basis, in its ordinary sense, was invented to deal. Again, in his judgment the University was the only possible tenant of these buildings. The rental of the Parochial Assessments Act must be a business rental, to be obtained with reasonable probability. A method by which antagonistic opinions as to the value of these buildings was brought into some relation with actualities was adopted by Mr. Ryan for the assessment committee, and with slight variations by Mr. Eve for the University; and this he, for brevity, would call the "substitute building" basis. The method pursued was to measure up each existing building, to ascertain the purpose for which it was used, and then to estimate the cost of erecting an imaginary building in its place suitable for those purposes.

This method was one which appeared capable of leading to a just and reasonable conclusion as to the rental which it was his duty, under the Parochial Assessments Act, to endeavour to ascertain. Mr. Ryan estimated the cost of the substitute building on the average of 1s. per cubic foot, and Mr. Eve 9d. per foot. In his opinion the University authorities, regarded merely as managers of a business, were wise to consider within reason, architectural beauty as essential to their buildings. The beauty and stateliness of her buildings were of real value to Oxford, and, in this matter, that the University authorities should study sentiment without extravagance was to follow sound business principles. He was, fortunately, without the guidance of actual facts, as in erecting new schools the cost was at least 1s. 2d. per cubic foot, and he had no hesitation, therefore, in adopting generally Mr. Ryan's figure of the capital value of the "substituted buildings." He had made an exception in the case of the Sheldonian Theatre, which was, in his view, on the evidence, of little if any practical use to the University. It became necessary, in order to arrive at the rent which a tenant from year to year could reasonably be expected to give for these buildings, to consider what rate of interest should be applied to the figure thus ascertained, and he was of opinion that 3 per cent. was, in all the circumstances of the case, the proper rate of interest. The University had proved to be able to raise money at that rate. He believed that no higher rent than that which he had arrived at would be paid by the University as tenant for these buildings. As to the land or sites upon which the buildings stood, he failed to see any reason for taking it out of the ordinary rule, which he valued it by comparison with land used for similar purposes in the vicinity; and here again he was not without the guidance of actual facts. The University Court was not, in his opinion, rateable, as the purposes for which it was used were subsidiary to the use of it as a court of justice. As to whether the houses occupied by the curators of the museum and of the University Observatory should be separately assessed, the "occupation" was in each authoritatively prescribed, was necessary for the proper performance of his duties, and was under the control of the University; he was, therefore, of opinion that the occupation was that of the University, and that the houses should not be separately assessed. The result of the appeal was that the rate imposed by the assessment committee upon the University was substantially reduced, and if the University asked for costs he thought they were entitled to them.

With regard to the colleges, the Recorder said in the case of Magdalen College (which was taken as a test case) that the President and scholars appealed against a rate of 5,625l. gross and 4,500l. net, being an increase on the figures arrived at by compromise in 1895 of more than 50 per cent. As in the case of the University buildings, it was common ground between the leading witnesses on both sides that the ordinary "contractor's basis" could not be adopted without modification, and what he had before termed the "substituted building" basis was treated on both sides as the best available guide to the rental required by the Parochial Assessments Act to be discovered. It was urged at the conclusion of this evidence by Mr. Balfour Browne, for the assessment committee, that he should impartially disregard the whole of the evidence on this point, whether given on the one side or the other, and proceed by another method, viz. to value the buildings as they now were, and apply a rate of interest to the sum thus ascertained. The method adopted by the witnesses was, it was argued, wrong, because it withdrew from the "contractor's basis" its solitary element of precision, viz. the value of what existed, and imported into it an element of conjecture, viz. the value of what witnesses thought ought to exist. He was unable to accept this view. It was obvious to him that the application of the contractor's test led to results so extravagant that the judgment and experience of the practical witnesses compelled them to pronounce that this method brought them, not to the rent which a tenant from year to year might reasonably be expected to give for the hereditament, but to the rent which such a tenant could not be reasonably expected to pay. He certainly was not competent, unassisted by the evidence of practical men, to embark on an inquiry which they had rejected, not on legal principles, but on practical experience on a matter of fact. He arrived at 2,330,134 as the cubic contents of the building, and the cost of erecting it 87,413l. and added 3 per cent. to this figure. He omitted from the lump sum of 87,413l. the cost of substituting a chapel, and treated the building separately and put a rate on it as it stood. He did this because he was unable to believe that the college could reasonably be expected to give nearly 2,000l. per annum more rent because of the presence of the chapel, and he thought the college the only practical tenant. He was of opinion that the witnesses for the assessment committee had gone altogether wrong in putting a rateable value of nearly 2,000l. on the chapel, and he considered 200l. an adequate sum. In this case, also, the college was entitled to its costs. As to Keble College (the second test case), the Recorder said he was of opinion that in all the circumstances of the case

er cent. was a fair and reasonable rent to apply. As to the London Press, the appeal was also allowed. The counsel in each case applied for costs, and the application was granted. Mr. Lawrence asked for time to consider the judgment, in which it was considered necessary to ask for a special case. The Recorder granted the request.

### WESTMINSTER SCHOOL OF ART.

THE annual general meeting of the supporters of the Royal Architectural Museum and Westminster School of Art was held on the 19th inst. at the Museum in Tufton Street, Westminster. Mr. William Emerson, the president, being in the chair. The report stated that during the past year the Council had been obliged to undertake the entire renovation of the glass roofs of the older portion of the building, together with the repair of the front parapet and other parts of the building. The total cost of the work was 700*l.*, and to assist in meeting the outlay the sum of 350*l.* had been advanced by the Technical Education Board of the London County Council, without interest, repayable in four instalments to be deducted in the annual grants made by the board to the school of art for evening classes, except the men's life class, had still further declined during the past year, owing doubtless to the increase in the number of drawing classes established in various parts of London at normal fees, and even without payment. On the other hand, the grants received from the Board of Education for the session 1900-1 amounted to 206*l.*, or upwards of 30*l.* in advance of the grant for the session 1899-1900. The financial statement showed an excess of expenditure over income for the year of 157*l.* The chairman, in giving the adoption of the report, said that deficit was largely accounted for by the repairs which were undertaken during the year. The school continued to be appreciated by advanced students and artists of high standing, and he was confident that it was doing a good work. Mr. W. Brindley seconded the motion, which was adopted. Mr. Emerson was re-elected president, and the vice-presidents, with the committee and other officers, were reappointed. Mr. J. P. Seddon called attention to the fact that provision was made for the free use, within certain limitations, of a number of students in drawing and modelling at the evening classes of the school. Candidates had to be workmen resident within the city of Westminster, or the sons or daughters of such workmen, and there was no actual limitation as to age.

### A RUINED MARTELLO TOWER.

IN Colonel Landmann's interesting "Adventures and Recollections" there is a report of a conversation with King George III. on the subject of Martello towers. The king was spending his holiday in old-fashioned style at his favourite watering-place Weymouth, where Landmann was at the time, when he was employed for the War Department in the erection of Martello towers. A French invasion was anticipated, and,

Bony single-handed, I'm sure I should. I should give him a good thrashing, I'm sure I should—I'm sure of it." The word Martello was believed to be derived from marine or maritime, but it is more probable the name should be Mortella towers, since it may have been derived from that of a fort in Mortella (Myrtle) Bay, Corsica, which after a gallant resistance was taken in 1794 by a British naval force. Several such towers were built on the coasts of this country, in Jersey, and elsewhere; but many of them have been taken down, from an opinion that the defence which could be made from them in the event of an invasion would not be adequate to the expense of keeping them in repair. They were generally two storeys high; the lower storey was divided into

chambers for the reception of stores, and the upper served as a casemate for troops; the roofs were vaulted, and that of the upper storey was shell-proof. The wall of the building terminated above in a parapet, and on the terreplein of the roof were placed pieces of artillery which rested on platforms of timber traversing on pivots, so that the guns were capable of being fired in any direction. The entrances were at a considerable height above the ground, and over these were machicolations. Outside were a ditch and glacis.

One of the examples which survived was Sandgate, on the coast of Kent. About two years ago it was undermined by the sea, and, as will be observed from the photographs, was as completely ruined as if an earthquake had occurred. It will be seen what an exceptional character was the construction. It would probably have been able to resist any of Napoleon's guns, but could not withstand the slow operations of sea-water.

According to the legend which Mr. Thomas Hardy utilised, the French emperor crossed to Weymouth in order to reconnoitre for a landing. King George was not scared by any apprehensions. He said to Landmann, "I should like to fight

The example is interesting, for it reveals the consequences which are to be expected when water once finds admission to foundations, and is able twice a day to repeat the process. For the photographs we are indebted to Mr. Norman Carew Dundas.

## NOTES AND COMMENTS.

THE memorable event of this week, by which Great Britain was to be endowed with a successor to the EDWARDS and HENRYS of the olden times, would have given as much gratification to architects as to any other class of Britons. They have therefore joined in the universal regret which has arisen in consequence of the postponement of the ceremony, and will also ardently desire that HIS MAJESTY'S strength will soon be renewed. No men can be found who exceed them in loyalty to the throne. Their work depends upon the stability of institutions, and they must rejoice at the prospect of the continuance of the same conditions which have made this country prosperous beyond all others. In a constitutional country like ours it is absurd to expect that any monarch would imitate LOUIS XIV. or the third NAPOLEON, when he transformed Paris. In his private capacity the KING has shown an interest in architecture which it would be well if all country residents would imitate. But architects must remember with gratitude that although from his boyhood he has had constantly to refer to subjects relating to art, HIS MAJESTY has never attempted to take any particular style under his protection and to promote it by the sacrifice of other styles. That, we believe, has been a distinct gain, for, although critics may dwell upon the shortcomings of English buildings, improvements will only be arrived at by the exercise of liberty and the conviction derived from experience of what is proved to be the best.

ONE of the results of the exhibition which has been held at Madrid to celebrate the KING'S accession has been the revelation of the power as a painter of DOMENICO THEOTOCOPULI, who is more popularly known as "El Griego," or the Greek. Many of the pictures by him were lent from private collections, and were therefore less known than those seen in the Prado, the Escorial and the churches at Toledo. He was a Greek by birth, and, it is believed, studied under TITIAN in Venice. THÉOPHILE GAUTIER says that GRIEGO'S *Interment* in the Madrid Museum has parts which are worthy of TITIAN'S pencil, but he also points out the work which represents the other extreme of the painter's skill, a picture showing monks about to perform penitential exercises, which in its funereal gloom exceeds anything to be found in the romances of Monk LEWIS or ANNE RATCLIFFE. This same critic found a like difference in the Greek's paintings in Toledo; there was either a marvellous resemblance to the style of TITIAN or the most bizarre composition and colouring; a depravity of energy was a sign that his genius was conquered by folly. Even in the worst of them, said GAUTIER, there is something which sets us dreaming. We have only a small work by him in the National Gallery—a *St. Jerome* in a cardinal's robes. THEOTOCOPULI died in Toledo in 1625. VELASQUEZ was then in his twenty-sixth year, and some have asserted that the Spanish master was a follower of the Greek. But it would be puzzling to trace any resemblance between their works. VELASQUEZ might seek humble subjects, but he never produced anything so fantastic as those which represent the second manner of EL GRIEGO.

M. HARDUIN, in the last number of *L'Art*, expresses his approval of the project of M. PAUL LEROI for the erection of buildings to accommodate the exhibitions of French artists. The latter proposes that a site should be purchased on the Boulevard des Capucines and a building erected which would serve not only as galleries for the display of pictures, statues and designs, but would supersede the inconvenient rooms of the Hôtel Drouot for holding auctions. It will be said that the artists already possess a palace in the Champs-Élysées for their exhibitions. But they hold it merely on sufferance, and at any time it could be taken from them. It will be remembered that during the operations connected with the international exhibition of 1900 it was necessary to construct temporary premises at a large expense. The purchase of the property and the erection of a building from the designs of M. VAUDREMER would cost about 15 millions of francs, which would mean an annual payment of 675,000 francs. The sum may appear to be large, but if the French artists had any enterprise it could easily be made up. The great obstacle is that Frenchmen have grown so accustomed to be under the

wing of the Government, they now hesitate before accepting the risks of independence.

## ILLUSTRATIONS.

## NEW BUILDINGS IN COBLENZ.

HOLY ROOD SANCTUARY SCREEN, ST. MARY, HOUGHTON, HANTS.  
NOT many years ago we published drawings by M. F. K. OLIPHANT, A.R.I.B.A. Since then he has been ordained, and is now rector of Houghton, near Huntingdon. His architectural training has not been a waste of time, for he has had opportunities to exercise his skill. The Rev. Mr. OLIPHANT, it should be understood, has no desire to compete with laymen who are architects; he accepts no fees, and a few months since it gave him satisfaction to hand over the restoration of a tower to a Cambridge architect. Having discovered indications in the church of St. Mary, Houghton, which warranted the conclusion that a rood-loft and screen once existed, he was asked to allow a screen to be erected by members of the ANSLEY and MARTELLI families, he decided to adopt the ancient form. Believing that the principal purpose of the screen should be the display of a rood, he has made the cross prominent in the design. Figures of St. MARY THE VIRGIN and St. MARY MAGDALEN, the patron saints, are also introduced. Between them are briars and roses, typical of the joys and sorrows of the cross. The cross itself is surmounted by a crown with a copper hood, beneath which a figure of CHRIST will, no doubt, be shortly placed as was intended, for without, the rood is incomplete. From the illustration it will be seen that while there is extreme simplicity, symbolism is respected and suggested. The rood-screen imparts increased solemnity to the interesting church. The work was carried out by Messrs. SKEELES BROS., of St. Ives. The carving is by a young artist, Mr. THOMSON, of Alconbury, and the pierced metal lock, plates and other metalwork by Mr. JUDE of St. Ives. The work is, hence, an example of local craftsmanship, and that enhances its Gothic character.

## CHURCH OF ST. PAUL, KINGSTON HILL, SURREY.

THE existing portion of St. Paul's Church, Kingston Hill, was built some fifteen years ago, and consists of a nave, north and south aisles and a north porch. The original design included a massive central tower, but the present building committee, under the advice of the architect, have decided to omit this, partly on account of the cost of its erection, but also that it rather hampered the plan for present requirements on a somewhat limited building site.

The additions now proposed to be erected are a chancel 42 feet long by 24 feet wide; a transept on the north side, 22 feet deep by 20 feet wide, specially arranged with its own porch for the use of school children, clergy and choir vestries, each 20 feet by 11 feet 6 inches, filling up the space in the north-east angle, with the heating chamber beneath them approached from the outside by a stairway in the north turret. The organ chamber is on the south side opposite the transept, and a parish-room 30 feet by 19 feet, east of the organ chamber, completing the south side. A substantial bell turret will be built over the chancel arch. The materials proposed to be used are similar to those in present building, viz. Box ground for quoins and weatherings, Corsham for moulded detail and random-coursed rag for facings, to be backed up with hard brickwork. The roofs to be covered with green slates and red ridge tiles. The approximate cost of the additions is a sum closely approaching 7,000£, and the work will be commenced so soon as the funds reach half that amount. The architect is Mr. THOS. GARRATT, of Kingston Hill.

## CATHEDRAL SERIES.—RIPON: SOUTH CHOIR AISLE, LOOKING WEST.

## LA ROCHELLE (HOTEL DE VILLE).

IN referring to the Queen's Hotel, Leeds, last week, it should have been stated that the ceiling is in plaster. The panels referred to as decorative are figure-paintings. The interest of the room as an example of Burmantofts faience is not diminished by the correction.

## ACOUSTICS OF AUDIENCE HALLS.\*

THESE are certain factors to be considered in the designing of a hall of audience which are of such vital importance that to neglect them in the slightest degree is to court failure. All things considered, the most essential requisite for a public hall is that it shall have good acoustic properties. The architectural design may be wholly lacking, the sight lines may be ignored, the heating and ventilation unmanageable, and the hall may yet be made of some use; but if the acoustics are wrong the hall is useless. It would seem, therefore, in this age of specialised knowledge, that there ought to be not only definite data as to what constitute a bad hall and the causes for its defective qualities, but there should be at the hand of the designer abundant logical means of determining in advance just what will insure good acoustic properties. As a matter of fact, however, there is no department of applied science to-day in which the available knowledge is so deficient as in acoustics. The problems have been studied over and over again, but they are so intangible, it is so difficult to rightly analyse, and it seems so nearly impossible to construct synthetically proper acoustic conditions that we are obliged in the present state of our knowledge to depend for guidance almost entirely upon experience. And even in this respect we are often led astray, for where we cannot deduct definite data from known conditions it is, of course, well nigh impossible to be sure of the results of the application of such facts as we can collect. The writer has from necessity made a considerable study of this particular subject, and while being utterly unable to arrive at any scientific deductions or to gather any generalisations which can be rigidly applied to the designing of new structures, there are at the same time a number of results derived from personal experience which are of certain interest, and which can profitably be considered in planning in advance for good acoustic properties.

There is a popular conception that the acoustics of a hall may be admirable for music while poor for speaking, or *vice versa*. I have yet to find this substantiated by facts. A hall without a certain amount of resonance, for instance, is good for neither music nor the voice, while the least particle too much resonance is just as fatal to correct musical effects as to speaking. It has sometimes seemed as though acoustic defects were made more manifest by music because the tones being purer in quality than the human voice, were more susceptible to interference, but, at any rate, investigation has thus far failed to discover a hall thoroughly satisfactory for music which was not equally so for the voice. Another popular fancy is that every structure has its exact note in a musical scale, and we are sometimes even told that a fiddler, if he only knew how, could fiddle down a building even heavier than London Bridge. As they say in the papers, this is important if true, but personally I do not believe a word of it. Nor can I find that a hall has an individual pitch to which a speaker must accord his voice. It would be a poor hall indeed in which a speaker would be at his best in only one pitch, and such halls practically do not exist. Up to a comparatively short time since it was my conviction that the most suitable shape for a hall of audience was one in which the width was considerably greater than the length. A wide auditorium has the seeming advantage of bringing the people closer to the stage, and it might readily be agreed that good acoustics would result. But I have not yet found an especially satisfactory audience-hall of this shape, and I have found several that were defective, in that the hearing was confused and the sound lost in fulness. When the Boston Symphony Hall was built by McKim, Meade & White, a great deal of attention was paid to acoustics, and most elaborate calculations were made by Professor Sabine, of Harvard (see *The Architect* of 1900), to determine a number of points in relation to both material and shape, and an elongated plan was decided upon following very closely the lines of the celebrated Music Hall at Leipzig, which is acoustically a great success. The Steinert Hall in Boston is an auditorium about sixty per cent. longer than the width, and the width increases somewhat towards the rear, the side walls not being parallel. This is one of the best halls for chamber music in the country. On the other hand, there is a hall recently built in Boston which is considerably broader than it is long; repeated attempts have had to be made to alter the effects of music in the hall, which is now very lacking in quality and volume. The hall of Tremont Temple in Boston is a rectangle approximately 70 feet wide by 120 feet long, and the acoustics both for speaking and for music are, as far as can be determined, perfect. So that consideration simply of acoustics seems to point to a rather elongated hall as on the whole safest. A better plan, however, in my judgment, considering both the acoustics and the lines of sight, is to make the auditorium practically a square, limiting the width to 90 feet at the most, as beyond that width the extreme sides are apt to suffer.

A rectangular auditorium whether concert hall or theatre,

should not have a rectangular proscenium. In theatres which seem to be the most successful acoustically it has been found that the walls immediately preceding the curtain opening, or what is known technically as the proscenium, are built at a slight bevel outward, and the ceiling over the fronts of these boxes and connecting the two sides is slightly arched on a bevel corresponding to the angle of the sides. An illustration of this is afforded by the Auditorium Theatre of Chicago, the acoustic properties of which are marvellously successful. In this building the bevelled walls on each side of the proscenium are carried far out into the auditorium, and there seems to be a reasonable ground for the theory that the sound issuing from the stage is in a measure directed and equalised toward the audience. Of course it is absolutely impossible to prove such theories, but we find the conditions of the bevelled sides and tops in nearly all theatres which are acoustically successful and we can reason safely from that that a theatre built on such lines is not apt to be a failure.

In my judgment it is essential that the main ceiling of any auditorium should be slightly varied in level, that is to say, not one unbroken surface, and with a sufficient number of distinct breaks either by beams, circles, or some other architectural device, so that any sound waves which might be supposed to impinge upon the ceiling would be scattered and dispersed rather than reflected to the audience. Any arrangement of domed surfaces, however, on a ceiling implies a certain risk. There are very few instances which have come under my observation of domed auditoriums which were wholly successful acoustically, while there are a number of instances in which a dome was presumably the cause of poor acoustic properties. The Paris Opera House is one striking instance.

The exact form of the balconies and galleries I cannot find has any special relation to the acoustic properties of a house. There is an idea that a wide overhang, with corresponding pockets, as it were, under the balconies or galleries, is liable to make trouble. This is not substantiated by facts. In Tremont Temple, which has a very deep pocket under the gallery, no difficulty was experienced with the acoustics. So it is only on the grounds of better sight-lines or more comfortable auditorium that there would appear to be any special necessity for avoiding deep overhangs.

While the ceiling should be broken, and the more the better, the same does not hold true of the walls. In the new Boston Symphony Hall the side walls are very much broken by pilasters and deep niches. It would hardly be fair to say the acoustics of this hall are poor, but there have been complaints, and personally I feel that a simple wall treatment would be safer. Musicians have said that Sanders Theatre in Harvard University is the best hall in the country for music. It has a broken ceiling and plain walls. Tremont Temple is the same. Successful theatres are invariably so. A slight cove between the wall and the ceiling line is usually an improvement, while a large cove, unless it is an irregular one which is considerably broken up in its horizontal dimensions, is often a source of trouble.

So then, from the foregoing, the ideal auditorium would seem to be one with a very elaborate ceiling, rather simple walls, a width of perhaps 80 or 90 feet, and a depth of perhaps 100 or 115, with projecting proscenium walls set at an angle to the centre line and an arched ceiling overhead. I do not know of a single theatre which follows these lines in which bad acoustic properties have developed.

There are several minor details of construction to which can be traced some elements of acoustic success. The stage level is best set at about 3 feet above the lowest portion of the auditorium. Every inch of increase over this height means a possible loss in the clearness with which the auditors can hear speaking from the stage. Furthermore, the height of the uppermost seat in the balcony should not be above the top of the proscenium opening. This does not imply that in order to get higher seats the proscenium opening can be raised, for the best shape of opening seems to be one in which the height is rather less than the width, in which the corners are at least slightly round, if not arched. So that the height to which the uppermost seat can be raised is, in a sense, a direct factor of the width of the proscenium opening.

The material of finish exercises considerable influence upon acoustic properties. In talking with a number of theatrical managers in various parts of the country I find a strong preference expressed for houses in which a good deal of wood is used in the construction, with wooden dadoes, or panelling, carried as high on the walls as possible, and wooden floor boards nailed to sleepers so as to allow a slight air space underneath. Wood is certainly far more resonant than hard plaster or metal. Our building laws oblige us to use a great deal of fireproof material, chiefly plaster. But it would seem advisable to cover this as far as possible so as to present wood rather than a hard surface to the sound. The balance of evidence is in favour of soft wood for finish rather than hard as far as it has any perceptible effect on acoustics, but this is a point extremely difficult to determine.

\* A paper by C. H. Blackall in the *Technograph* for 1901-2 of the University of Illinois.

In the case of a concert hall, in which the platform is slightly raised above the floor and recessed with finished walls on three sides, the recess should not be rectangular, but rather the wall should be set on a bevel, following out the idea of a theatre proscenium. A hall in Boston which has recently come under my observation was built with a rectangular recess for the platform. The acoustics were found to be very bad. The hall is now in process of being changed, the sides to be bevelled, and from the experiments that have been made so far it is believed that this simple change in the direction of the side walls will remove the acoustic troubles. There should be no window at the rear of the recess, and it is safer to have the walls of the recess constructed as partitions rather than that any of them should be part of an outside wall.

The height of the platform in a music hall has a very perceptible effect on the quality of the music. When Steinert Hall in Boston was built the original intention was that there should be no platform. This hall was intended principally for piano recitals, and it was thought the best results would be obtained by putting the piano directly upon the floor. When the instrument is set up at any height above the spectators the music seems to come from the bottom of the piano rather than the top, and the tone is very much impaired. It was found, however, in this case that the auditors objected to the performer being placed so low on account of sight, and the platform has been successively raised a few inches at a time, until now it is 2 feet above the floor. But musicians have expressed the opinion that the sound of the music would be better if the platform were omitted entirely.

Some curious observations were noted in connection with this platform. As at first constructed the top was of spruce boards, unfinished. As an experiment these boards were shellaced and varnished, and it was found that the quality of the music was very much improved thereby. The effect of varnish on wood is something that is difficult to rightly gauge. Our modern violin-makers are able to produce an instrument which in the raw wood is fully the equal in tone of the old historic violins, but the moment the wood is varnished the peculiar mellow tone of the instrument suffers a distinct loss. Violins can be made as well now as ever, but the secret of properly varnishing them so as to retain the tone is a lost art.

A factor in the acoustic properties of a house which is very often underrated is the quantity of moisture in the construction. Shortly after the Colonial Theatre was finished it was visited by Annie Russell's company, which included a number of actors who had been used to small houses and found themselves rather at a loss in the larger theatre, so that the management very soon began to receive complaints of the acoustic properties of the house. One of my friends specially took me to task for it, and declared that he could hear nothing at a performance. I investigated each complaint very carefully and could not find any distinct acoustic troubles. During the ensuing summer a few changes were made in the auditorium, and in the fall my friend met me and expressed great delight in the improvement we had made, and wished to know what it was we had done which had so thoroughly changed the acoustic properties of the house, which were now perfect. I assured him all we had done was to change the colour of the draperies, which amused though did not convince him that we had made no radical change. Thinking the matter over since, however, I am inclined to believe that a change was wrought in the auditorium during the summer, consisting simply in the thorough drying of the house, and it is a fact which has been quite amply demonstrated that an old building is less apt to give trouble than a new one, especially if the latter is of fireproof construction and necessarily very damp for quite a while after completion.

The effect upon the acoustics of the heating and ventilation of a hall is not always easy to measure. We know that sound-waves will travel with less distortion across a current of air than with it. When the sound-waves and the air are travelling in the same direction the sound is very apt to lose in clearness, and therefore the best way to heat an auditorium would appear to be to introduce the air from the bottom and take it out at the top, so that the currents would be at right angles to the sound-waves. By sound-waves I mean in this connection the portions which go directly from the source of sound to the average observer. Of course the waves are really spherical, and might be assumed to act and react from all directions. But the only waves which we can fairly consider are the direct ones. Theoretically, at least, it would appear safer to as far as possible suppress the action of all other waves, and in theory at least this can be done by rendering wall surfaces, &c., absorbent, but practically I do not know of its ever having been actually accomplished. Very elaborate attempts were made in connection with the large hall of the Trocadéro, at Paris, to absorb the superfluous sound vibrations, but the results were quite unsatisfactory. More recently, Professor Sabine has made some elaborate investigations to determine the coefficients of absorption of various substances and walls. These coefficients are aids, but are by no means infallible guides. In fact, one of the discouraging results of scientific investigations is that in most

cases where deliberate attempts have been made to scientifically solve in advance the acoustic properties of a house the results have been more or less failures.

A hall which has a slight echo when empty will very often be perfect when filled with people. Sound appears to travel with less distortion in a low temperature than in a high one, within certain limits, at least. A carpet on the floor tends to slightly lessen the fullness of sound in a room which is only partially occupied, but in a theatre, for instance, when the hall is crowded I fail to detect any difference with carpeted or uncarpeted floors.

There is no lack of confusing facts regarding acoustics, and echoes especially are by no means easy to locate. In the auditorium of the Colonial Theatre the acoustics are as nearly perfect as one could wish, but in the ticket office, a room about 6 by 17, and not over 8 feet high, with a hollow floor, and the walls lined with cases, there is a very pronounced and disagreeable echo which I have been utterly unable to either locate or stop. In the building of the Master Builders' Association in Boston there is a room about 20 by 30 and perhaps 14 feet high, in which it is very difficult to speak. Sound has no fullness and seems to keep back around one's ears. Immediately adjoining is a large room with probably twenty or thirty times the cubic contents, in which the acoustic properties seem to be perfect. The construction of the two rooms is identical. I have found it more often the fact that echoes or sound disturbances will occur in small rooms than in larger rooms. If any one wants a practical illustration of how difficult it is to speak and hear distinctly in a small space let him put his head under the clothes when he goes to bed and try to talk out loud, and he will realise the difficulties that sometimes arise in a small room. I had some experience a short time since with two rooms identical in construction, size, and finish, except that one had two chandeliers and the other one. The latter was abominable for acoustics, and the first was apparently perfect. We added a chandelier in the second room, and the trouble seemed to be entirely remedied. I am sure, however, that it would puzzle any one to explain why so slight a change would make so much difference.

I have made many inquiries among musicians as to the best construction for an ordinary small music room such as would be found in a private residence, and, summing up the consensus of opinion, it would seem as if the following would be pretty likely to insure good results: The floor should be of wood, uncovered, and laid over sleepers as small as possible, and spaced not less than 6 or 8 inches apart, much in the manner that the sounding board of an ordinary upright piano is reinforced by battens. The floor boards had best be of clear white pine  $\frac{1}{2}$  or  $\frac{3}{4}$  inch thick, thus leaving an air space underneath between the battens. The walls up to a height of about 7 feet should be panelled in soft wood and painted white. Above that the walls should be slightly broken by pilasters and the intervals cased with mirrors. The ceiling, which should not be less than 12 feet high, should be broken by beamwork in each direction, the beams being recessed 8 or 10 inches, and finally, if possible, there should be no outside walls. The room should be an oblong in the relative proportions of two to three, with a height a little less than the width. And the piano should be placed in the middle of one end of the room, in such position that no two of the legs or supports would rest over the same floor beam. This construction has been tried to my knowledge twice with admirable success, and as a result of experience seems to be justified.

All of the foregoing is, of course, entirely empirical, and is the result of personal observation. In time we will undoubtedly be in possession of exact knowledge with which we can determine the qualities of proposed halls as accurately as we now determine our construction, but at present there are very few rules that bear the test of application, and all the scientific data which I have ever seen published is nothing but the formulation of experience.

## DECORATIVE ART AT TURIN.

VERY little has been written as yet in English newspapers about the Turin Exhibition of Modern Decorative Art. Those who confine their artistic interests to the yearly picture shows will not, says the *Times*, consider this strange. Nor would such an exhibition appeal to critics who regard art merely as a branch of archaeology. To any one, however, in whose eyes art is closely related to life—to modern life as much as to life in past ages of the world—this first International Exhibition of the Decorative Art of our own time must suggest many thoughts, and must appear to be an event of profound significance. Especially should we in this country look with interest upon it, for the chief impulse towards the revolution of which the exhibition is a sign came undoubtedly from our island.

The strange and, to Englishmen, the humiliating thing is that in the galleries at Turin, England, the leader in the

movement, takes an insignificant place. One reason for this is not far to seek. Most of the other countries represented have had the spending of large contributions from their respective Governments. Austria, for instance, has had erected in the grounds two delightful buildings for the display of Austrian exhibits. One is a small palace full of miscellaneous wares, the other a beautiful little villa, with its rooms fitted up by different firms in perfect taste, illustrating all the latest ideas of domestic decoration. These buildings were designed by an architect in the service of the Austrian Government, and a large sum of money was granted in order to enable Austria to take a prominent place at the exhibition. Belgium, again, has a section designed by a Government architect. France, it is true, received no Government aid; but this is scarcely noticeable, so admirably has individual enterprise done its work. The English section alone is planned on the regular old-fashioned exhibition model. All the other sections are fitted up like spacious, sumptuous rooms—carpets, wall-papers, hangings, every accessory of adornment falling into an harmonious and ordered scheme. In the English section there are simply partitions, upon which the exhibits are mostly placed, with a few quite ordinary showcases down the centre. In themselves the exhibits do not compare, on the whole, at all unfavourably with those of other nations. There is a great deal of good and interesting individual work. But it is so placed and arranged that most of its effect is entirely lost. For example, there is a very fair collection of wall-papers, the work of Mr. Voysey, Mr. Vigers and other designers. But these are so arranged, with cases and pieces of furniture in front of them, that half of them cannot be properly seen. Again, there is a charming harpsichord, designed by Mr. Arnold Dolmetsch, which ought to be so placed that every detail of its decoration can be studied. It is, however, put against a wall, and certainly does not leave upon the mind the complete impression of beauty which its designer intended. Then there are in the English section too many pictures of things. The photographs of the principal works of distinguished architects of the last twenty-five years are interesting and well deserve their place. But the general effect left upon the spectator's mind is that of a section in which you are told what English artists and craftsmen are doing, but which does not show you sufficiently their actual achievements. There is a fine piece of Morris tapestry and a number of Ford Madox Brown's figure designs to show what were the ideals of an earlier generation. There is some good jewellery—too little of it, though; there is a case of Mr. Benson's copper wares for table use; there are a few pieces of furniture, mostly sent by the Guild of Handicrafts, and there is some interesting metalwork. But the show does not make it appear, as it ought to do, that the first enthusiastic rapture of the English school of artistic craftsmanship has of late years largely widened its influence. Mr. Walter Crane, who went to Turin to arrange the exhibits collected by the Arts and Crafts Society, has a large exhibition of his own drawings and designs. He was specially asked to show these by the organisers of the exhibition. It is unfortunate that Mr. Crane's work does not gain in effect by being seen in large quantities at a time.

The Scottish section is set out with a good eye to effect and decorative charm. Everything is made the most of, and the colour scheme against which the exhibits are shown up is attractive and interesting. Curious it is to notice how the Scottish nature, as soon as it is released from the bondage of severe form and colour, rushes to the opposite extreme. "Perfervidum ingenium Scotorum" once again. Mrs. Margaret Macdonald Mackintosh's panels demand and obtain a great deal of attention. There are some amusing chairs—amusing in their fantastic shape and in the insistent hues of their upholstery. They are mostly too strange to be acceptable in daily life.

The pleasantest furniture in the exhibition comes from Holland and Germany. There is a very charming room arranged by Professor Olbrich of Darmstadt, and filled by him with beautiful things of his own designing. In the Dutch section there is a delightful little bedroom that calls forth constant admiration. The quiet charm and dignity of the furniture in these sections forms a curious contrast to the violence and eccentricity of many of the sets of chairs and tables and sideboards and cabinets in the French, Italian and Hungarian sections. The sort of things that we see in these latter resemble the furniture which was exhibited last year, upon the initiative of a well-meaning but misguided enthusiast, at the South Kensington Museum. As a set-off, however, there is in the Hungarian section some charming jewellery; in the Italian many examples of exquisite and powerful modelling (notably the bronzes of Signor Bialelli); and in the French section numbers of beautiful things—stuffs, glass, pottery, reliefs, enamels and so on—all showing the French love of form and the French admiration for all that is exquisite and daring in design. America has a large but not very attractive section. There are some

good bronzes, of a size suitable to small rooms, and some interesting architects' designs. It is astonishing what an architect of resource and invention can do, even when he has to plan huge "sky-scrapers" fifteen and sixteen storeys high. A very pretty garden plan on the prim, formal model shows that the Americans are devoting some attention to this form of outdoor decoration, which has rather fallen out of favour in Europe.

Most of the nations have seized upon the opportunity to show not only what their art-craftsmen are thinking, but how commercial firms are carrying out their ideas. If this feature were pushed to an extreme, it would make the exhibition too much of a tradesman's show. But this is not the case. It is a pity that the opportunity was not offered to a few English firms to prove what they can do in the way of decorating houses. We have no need to fear comparison in this respect with the decorators from Paris, from Vienna and from other continental centres, whose wares obtain an excellent advertisement at Turin.

The exhibition remains open until November. Numberless English people on their way to Italy pass through Turin in the course of the late summer and autumn. It would be a pity that any one interested in the recent developments of decorative art should miss seeing an exhibition which offers so much food for reflection and so much stimulus towards a just appreciation of the attempt to bring more beauty into everyday life. They will see much that must seem odd and, at first sight, unattractive. But the sum of their impressions will be pleasant and of good augury for the future. As it is with the objects exhibited, so is it with the exhibition buildings. Some of these are restless and bizarre in effect, but the general appearance of the galleries is satisfying and even dignified, and they are set in the midst of a charming park, washed by the river, and filled with trees and green spaces. Especially good are the large figures in plaster which adorn the grounds and buildings. In this branch of art the Italians, who have lost the mastery of colour and composition, still excel.

#### ST. PATRICK'S CATHEDRAL, DUBLIN.

ALTHOUGH most people in Ireland have some feeling for their national cathedral, its true value from a historical and archaeological standpoint has never been apprehended. Without attempting to write its history in full, says the *Irish Times*, a few brief notes on its past story may fittingly lead up to the discoveries and achievements of the almost accomplished work of its restoration. The whole of the lands known as the Liberty of St. Sepulchre, near Dublin, were in 1190 possessed by the Archbishop of Dublin, and on them was the older Irish church of St. Patrick de Insula. The Liberty of St. Patrick's, as created by Comyn, was walled and fortified, and dignitaries' houses were built. They were, however, not maintained. We read of the unfortunate dignitaries in the sixteenth century that, "Being so daily and hourly preid and molested by their prowling mountain neighbours, they were forced to suffer their buildings to fall into decay, and embayed themselves within the city walls." Whether or not John Comyn, the founder, actually built the cathedral—indeed, only a superficial knowledge of the history of architecture is required to prove the ordinary guide-books wrong in attributing to that prelate a form of Early English architecture unknown in his day—the conception of a cathedral establishment formed by him and carried on by his successor is extremely noble and beautiful. The ground-plan, as a study on paper, shows a perfection of proportion and symmetry unexampled in England. It reveals itself, according to Sir Thomas Drew, as "the design of a mathematical mind which arrived at the proportions of a Latin cross by the placing together a number of absolutely uniform equilateral triangles." Through more than six centuries this design was obscured and inappreciable, since poverty and vicissitude had left it unfinished. Its north and south transepts were walled off in separation, and its lady chapel assigned to Huguenot settlers as a built-off church. It was reserved for the nineteenth century, when Sir Benjamin Lee Guinness began his munificent work of restoration, to reveal again to the citizens of Dublin how noble and impressive a church they possessed. And now in the twentieth century many will doubtless be surprised and gratified to learn of even fresh discoveries to heighten the national pride in the national cathedral. But first it may be asked, "If St. Patrick's was restored in 1865, how comes it to need further restoration in 1901?" The answer is a very simple one. When in 1865 Sir Benjamin Lee Guinness removed obstructions; restored the church to its original form and otherwise embellished it, the Early English Easter chapels, restored in 1845, appeared still perfect. Unfortunately a disastrous mistake had been made as to the stone used. Instead of the ancient wrought stone used in Mediaeval building, brought from the famous oolite quarries of Somersetshire, soft Caen

stone was imported, with which a brief fifty years of the Irish climate played utter havoc. As is well known, when Dean Jellett came to his deanery in 1892, he found the eastern end of his cathedral not merely in a dilapidated, but a dangerous state. So extensive was the damage, and so great the expense even of shoring-up, that, but for the timely generosity of Lord Iveagh, the cathedral would now be standing propped on a forest of timber balks, or perhaps not standing at all. In the course of restoring the choir aisles, the delightful discovery was made that under plasterwork of the time of William and Mary real and beautiful work of the thirteenth century had been hidden for many generations. Further, on June 18, as some will remember, the exact site of the original well of St. Patrick was discovered by Mr. Spencer Harty, within a few feet of the very place Sir Thomas Drew had predicted. The well itself was not in evidence owing to the diversion of the mischievous river Poddle; but the spot was marked by an ancient cross, of archaic type, pointing plainly to the old Celtic church, the far-off Irish St. Patrick's, before the Anglo-Norman cathedral. These two discoveries would in Italy, France or England evoke the liveliest interest and enthusiasm. But Lord Iveagh has done more. The great organ—no longer blocking the north transept—will be placed in a new organ chamber, 30 feet above the choir, reached by a lovely spiral staircase of stone, copied from one in Mayence Cathedral. The organ, while retaining its most famous stops, is provided with the newest system of hydraulic blowing; some of its pipes are 33 feet long and 6 feet in diameter. By an interesting coincidence the service of its dedication has been fixed to take place on June 18, the anniversary of the finding of St. Patrick's Well. Would it not be well that some sign, say, an Irish cross, should mark the spot of undistinguished corporation ground where it now lies unnoticed? One rejoices to learn that the ugly iron railings, suggestive of prison bounds, are to be removed, and green sward allowed to reach right up to the cathedral, after the fashion designed by its founder.

The manner in which the new flying buttresses and organ-chamber have been added, and the roof and transepts restored in complete harmony with their magnificent thirteenth-century character, and following their prototypes of Wells and Salisbury, reflects the greatest credit on Sir Thomas Drew, the architect; Mr. Ferrar, the clerk of the works; the builders, Messrs. John Thompson, of Peterborough, and their skilled workmen.

Irishmen and women will, we hope, awake before long to the great beauty of their restored inheritance.

### BRITISH COINS.

THE mode of coining in this country in 1289 was as follows. The metal was first cast from the melting pot into long bars. These bars were cut with shears into square pieces of exact weight; then with the tongs and hammer they were forged into a round shape, after which they were blanched—that is, made white and refulgent by nealing or boiling, and afterwards stamped or impressed to make them perfect money. This method continued till the screw was applied to coinage in the French mint in the sixteenth century, but not to ours before 1661, when it was used, together with the old method of coining by the hammer, until the latter was wholly laid aside in 1662. After the introduction of the mill the preservation of the outer edge of coins was first attempted by placing a grain, so as to form a regular circle on the outside of the legend, quite to the edge of the coin. The earliest specimen is of Elizabeth's reign; legends on the edge first occur in 1651; milling, with the strokes at right angles across the edge, in 1663; with diagonal strokes in 1669, with angular strokes in 1739, after which appears the method still in use.

Gold was first (except among the Britons) coined by Henry III.; silver through all the periods; copper, except James's farthing tokens, first in 1672; tin in 1684. Lead tokens, called Plumbei Angliæ, were in use as early as the end of the reign of Henry VII., and latten, tin, pewter, leather, &c., have been used by tradesmen, on the token principle, from the days of Elizabeth, perhaps earlier.

The cross upon Anglo-Saxon coins and in the Norman reigns is said to have been deeply impressed, that the coins might be divided into halves for halfpence and quarters for farthings, which practice, says Hoveden, continued till the time of Henry I. Leake denies this, but there is a passage in Whitaker's "Richmondshire" which shows that coins were actually halved and quartered for currency. The crosses were exhibited under almost every possible form before the 32nd of Henry III. Then, says Ruding, "The only difference between his earlier and later coinages is that in the former the cross is bounded by the inner circle and has four pellets in each quarter, whilst in the latter it extends to the outer circle and the number of pellets is reduced to three. To this de-

scription his gold penny forms the only exception. It kept entire possession of the coins until Henry VII. (*sic*, but armorial bearings first appear upon coins of Edward III., see Leake, iii.) introduced heraldic bearings. It then began gradually to give ground, but was not entirely lost before the latter end of the reign of James I."

The full face exclusively was adopted by John, and continued by all the succeeding monarchs until the side face was introduced 19 Henry VII. The last silver pieces upon which any of our princes have been represented with a full face are shillings of Edward VI.

The most ancient British coins are impressed on one side only and have no legend, only a device; those which have both an obverse and reverse are also without legend, except the coins of Sego[nax] and Cunobeline, with Camu[odunum] and Tascio. Ruding disproves all existing elucidations, and whether the following new remarks deserve attention shall be left to the decision of the reader. It seems to be generally allowed that the coins thus marked belong to Cunobeline, who was a Roman tributary king. It also appears from the coins in Ruding, which have this word, that their types are Roman. Melting pots or crucibles were made of an earth called *tasconium*, because that only would stand the fire:—"Catini fiunt (says Pliny) ex tasconio. Hæc est terra alba similis argillæ neque alia afflatum ignemque et ardentem materiam tolerat." L. xxxiv. c. 4. May it therefore be inferred that Tascio, like Augo for Augusto, is an abbreviation of *Tasconio*, and that the word may mean other coins melted down anew and stamped with Roman symbols to comply with their usual policy that the coinage should always recognise their dominion?

Some coins appropriated to the early Anglo-Saxons before their conversion to Christianity have either no legends or letters, the meaning of which has never been ascertained. The money of the Heptarchic kings has the name of the monarch on the obverse and that of the moneyer on the reverse, or after a certain period the place of the mintage. There also occur coins of saints and prelates with their names on the obverse, as STPETR. (*Sancti Petri*); SCEAD (*Sancti Eadmundi*); IAENBHRI. AREP. (*Jænbirht Archiep.*), &c. The sole monarchs have the same names of the kings with REX only, or REX ANGL. and the names both of the moneyer and mint on the reverse. The Norman kings continue the same practice, with very rare exceptions, Henry III. being the first king who has numerals after his name, though DVO follows the name upon a penny supposed of William I. DNS HYB first appears on the coins of Edward I., and in the same reign occurs the last instance of the moneyer's name upon the reverse. DVX AQT. first appears upon the coins under the three Edwards. Mottoes on the legends appear to have commenced with Edward III., and the first to have been POSUI DEUM ADJUTOREM MEUM, in allusion to the prosecution of his title to France, which motto was continued down to the union of the kingdoms, except upon the country mints of Henry VIII., the bad money of Edward VI. and the groats of Queen Mary. From this period to the time of Henry VIII. the mottoes are religious, but with that reign begin the *rosa sine spina*, conceits and classical phrases. These are very numerous and are detailed in Leake and Ruding. The *decus et tutamen* introduced temp. Charles II. still, or but recently subsisted.

The first named mint upon coins is Camu for Camelodunum (on coins of Cunobeline), and Ver. for Verulam. These on British coins, but the earliest instance among the Anglo-Saxons is that of Baldred, king of Kent, anno 805-823; nevertheless, the practice does not appear to have become general till the time of Athelstan, and was not entirely disused till the reign of Elizabeth.

Ruding says that the earliest specimens of mint-marks are to be found in the Durham mint of Edward I., that they first appear upon the regal coins of Edward III., that in the reign of Henry VI. they began to be varied, and that their number increased very rapidly in that of Edward IV. They were not entirely disused till the time of Charles II., a discontinuance ascribed to the introduction of the mill and screw.

Moneyers' names appear upon coins, usually on the reverse, but sometimes on the obverse (the name of the monarch being removed to the other side), as early as the seventh century. Sometimes the names of two moneyers occur on the same coin. This nomination of the moneyers is to be found no lower than the reign of Edward I.

*Numerals.*—1. Roman first appear on coins of Henry III.; 2. Arabic on those of Henry VIII.

The most ancient British coins are without busts and legends, having only a horse or hog (the most general patterns), an ox's head, rude lines, representations of the sun, &c., which are succeeded by barbarous human heads, figures with spears, riding, running or in chariots, &c. The Anglo-Saxon without busts and legends have the uniform obverse of a bird. Fillets of pearls and crescents distinguish the Anglo-Saxon kings of the Heptarchy, and rude kinds of crowns with rays and pearls are mixed with fillets among the sole monarchs. The sceptre

first appears on coins of Ethelred II. Edward III. in the ship is the earliest variation from a bust in the regal coins; the angel of Henry VI. has only the figure of St. Michael piercing the dragon, and succeeding sovereigns have coins with only the arms, badges, &c., for an obverse.

The most ancient British coins are convex, the obverse blank, and on the concave side are a horse, or rude figure, like the obverses before mentioned. Upon the coins with legends Roman devices are most numerous. The first Anglo-Saxon without bust or legend have no reverse, except in one instance probably a forgery, where we find Romulus and Remus with the wolf, a type repeated on the penny of Ethelbert, king of Kent. The reverses of the royal Anglo-Saxon coins are nearly all names of moneyers and mints, but monograms occasionally appear; and on a coin of Edward the Martyr is the hand of Providence, with the letters A and Ω, the only instance in which Greek characters are found on any coins of the Anglo-Saxon monarchs. The reverses of the Norman kings down to Edward I. consist of the names of the moneyer and mint, encircling crosses with pellets, fleur-de-lis, &c., and this favourite device of the cross and pellets occurs even so late as on the halfpenny of James I. After the reign of Edward III. his ancient pattern is, however, often superseded by devices connected with heraldry, as the royal arms, badges, crowns, fleur-de-lis, lions, &c., disposed within fancy rosettes, quarter-foils and other borders. The most singular reverse, in one sense a national insult, is that on the halfpenny of Charles II., where the portrait of Britannia is that of the Duchess of Richmond, the king's mistress.

From the time of Athelstan, with some few exceptions, the name of the town was added on the reverse, mostly to that of the moneyer, probably in conformity to his law, that the money should be coined within some town.

An uniform type of the coins was first adopted by Henry III. From the Conquest until this time, with the exception of the coins of Henry II. and the obverse of those of John, a great variety prevailed in the impressions both of the obverse and reverse.

There are no positive proofs of British coins contemporaneously with the time of Cæsar. The coins which are all attributed to the early British kings may belong to some other nation. The far greater part of them are without any legend, and in the rest are to be found only initial letters or at most single syllables, which are applicable to the names of Gaulish princes mentioned by Cæsar or Tacitus. It is possible that the coins which bear them might have been imported into Britain, and notwithstanding Borlase's denial of the assimilation between Gaulish and British coins, the horse and hog, the most common symbols of the earliest era, appear simultaneously upon the coins of both nations. After the Roman mintage was introduced the conformity may be reasonably supposed to have partially or generally ceased. If these coins are really British, their origin (says Ruding) must be referred to some period subsequent to Cæsar's second invasion, and prior to Cunobeline's improvement of his coins, in imitation of the Roman money. The earliest coin which can with any probability be attributed to any particular British monarch bears upon it the letters Sego, probably for Sego[nax], one of the four Kentish kings, who by the command of Cassivelaun attacked Cæsar's camp upon his second arrival in Britain. To his coin succeeded Cunobeline's money, evidently borrowed from the Roman model, but after his decease the second subjugation of Britain took place under Claudius, and the Britons were so completely subjugated that the edict ordaining all money current among them to bear the Roman Imperial stamp was strictly enforced, and no British money appears afterwards. Notwithstanding Verulamium, &c., in lists of Roman coins, Ruding says that no Roman coin bearing the name of a British town has yet been discovered.

The Saxons brought with them their coinage from the Continent. Sceatta are known of the early kings of Kent, some of which must have been struck within the sixth century, and there are others so similar to them in type as to justify their appropriation to the same people, but which, from their symbols, were evidently coined before their conversion to Christianity, and were therefore probably brought with them from the Continent. It is known only concerning the Heptarchic coins, that the money was of equal weight and probable fineness with the later Anglo-Saxon pennies, and that the moneyers stamped their names upon it, but that the custom of adding the place of mintage was of very rare occurrence, and almost solely confined to the ecclesiastical coins of Canterbury. There were no gold coins. The most ancient coin was of silver, and called Sceatta. The precise value is uncertain, but it was the smallest coin known among the Saxons at the end of the seventh century. The next coin in point of antiquity is the penny, which appears in the year 688, though the time of its introduction is unknown. It was of silver, and was probably not known to the Saxons before their arrival in Britain. Besides these, there was the half-ling, or hal-penny, likewise of silver,

as was probably the feorth-ling or feondvng, the fourth part, or farthing. Next to this were the stycas, of brass, two of which were equal to one farthing. These stycas are the minuta of Domesday Book, whence our mite; but all of the kind yet discovered are from the mints of the Northumbrian kings, or of the archbishops of York. Every one of these coins, except the farthing, is to be found in cabinets. Besides these, there was probably the triens, which divided the penny into three equal parts. The mancus, the mark, the ora, the shilling and the thrimsa were only money of account, not actual coins; and if the mancus was ever current it was of foreign mintage. The earliest Sceatta known is of Ethelbert I., king of Kent from 561 to 616. The first penny (though it is probably older) is that of Ethelbert II. between 749 and 760. The most elegant specimens of Anglo-Saxon coinage, supposed by Italian artists, are those of Offa, king of Mercia from 758 to 796.

## RUSKIN HALL, OXFORD.

A MEETING in support of the movement to place Ruskin Hall, Oxford, on a firm financial basis, has been held at the London residence of Lady O'Hagan. The Duke of Argyll, who presided, pointed out that Ruskin Hall did not aim at enabling its students to "get on." It did not wish to turn honest working men into superfluous journalists or school-masters. Each student was stimulated to seek knowledge in order to help his fellow men; and nothing had so greatly cheered its directors in their work as the splendid evidence which their students' letters had given that they were striving to realise that ideal. Their extension lectures emphasised the necessity of systematic and purposeful education on the part of reform forces everywhere. They adhered rigidly to the special ideal of Ruskin Hall, that not all knowledge was power, but only that knowledge which enabled a man to deal intelligently with the problems which confronted him. To carry out in a measure that ideal all the courses were arranged with relation to the social and industrial problems which were now agitating modern thought. They were endeavouring to follow out the ideal of Mr. Ruskin that there should be nothing meretricious or false in what they undertook, and that everything should be done in a spirit of truth and devotion to duty and to art. They were doing a great deal towards lightening the lives of their fellow-citizens. He congratulated them on their work, and hoped they would have a very useful and prosperous career. From the programme they had put before them they seemed to be following the right path, and not to have taken the name of Ruskin in vain.

Sir H. Campbell-Bannerman said that in Scotland universities had existed for generations, and they had succeeded in doing the very thing which Ruskin Hall was founded to accomplish, namely, to bring learning of the highest pitch and tone down to working men and those classes who in England had to a large extent been debarred from it. Anything which could induce the spread of the highest learning among the masses of the people, and do it, not in a patronising way, but in a way that would interest them and bring them into immediate sympathy with it, was of great value, and he could imagine nothing which could be more beneficial to the country. The old saying of a poet about a little knowledge being a dangerous thing had done more harm probably than any other twenty axioms of the sort that had ever been uttered. There was just enough truth in it to make it dangerous and mischievous. There could be no harm in taking people and teaching them what they did not know, as long as their heads were not turned by it and as long as they did not think they knew a great deal more than they really did. An institution like Ruskin Hall would give precisely the learning, and inspire precisely the sort of spirit which was desired, without having an undue disturbing influence on those who were subject to it. He trusted that an institution which was capable of doing so much good would live long and prosper.

Mr. Dennis Hird, the Warden, said that the Ruskin Hall was not connected with the University. They did not give classical, commercial, technical, or artistic education. Their main endeavour was to give a civic education. It had seemed to the founders that in this country the duties of the citizen had been rather overlooked and put in the background. They accordingly turned their attention to that subject. Their education did not equip a man to go out and make a living. They did not teach him anything which was marketable. They endeavoured to teach him the history of institutions, ideas and men, and so to make him an intelligent citizen in whatever branch of life he might be. Ruskin Hall was taking an important part in what they hoped was an intellectual awakening in the country. Their present hall had been bought up, and they would have to find headquarters elsewhere. They were accordingly making their first appeal to the public to aid them financially in securing a house of their own. Already they had received promises from two gentlemen of 1,000*l.* each,

and the Amalgamated Society of Engineers were going to make a levy of one penny a member in aid of their funds. A resolution was adopted expressing the hearty approval of the meeting of the work which is being done at Ruskin Hall, and a hope that it would receive all the financial support it so fully deserved.

### EDINBURGH SCHOOL OF APPLIED ART.

AN exhibition of work by students of the School of Applied Art has been opened. There is a remarkable collection of illustrations of old Scottish plasterwork and old furniture, of painting and mural decorations, a series of drawings of plasterwork from Scottish houses, and studies of stained glass. The students of the school have been successful this year in carrying off a large proportion of the prizes offered in London, together with the travelling bursaries presented by the school itself. The Lord Justice-Clerk, in declaring the exhibition open, said this school was started nine years ago, and filled what was felt to be a very great want in the city of Edinburgh. They had no proper school for the training of technical art, and it was felt that there was a want in the training of those who went in for applied art. It was not till the Board of Manufactures, who took a very great interest in these matters, moved that they were able to get this school. And the question was whether it was to be carried on or not. Like most questions in this world, it was a question of money. They had spent upwards of 9,000*l.*, and they had works of art for the purpose of instruction which were valued at 5,300*l.* For years they had had excellent assistance from the municipality, but lately the Council had felt inclined not to be so liberal as they had been in the past. But he hoped they would be roused to take a further interest in the school, which was doing a very great and important work. He thought there was no place in the United Kingdom which had more claim to have a school of technical art than Edinburgh. If they had had such a school some years ago in Edinburgh, they would not have had such a considerable number of monstrosities of architecture on the face of Edinburgh, which although they had failed to make her ugly, kept her from being as beautiful as she might be. He wished somebody would take 2 or 3 lbs. of dynamite and lay it beneath the monument which most people called "Nelson's Monument," but which he called "Nelson's telescope," and by blowing it up make it into a comfortable ruin. This school had been organised by voluntary effort, and he did trust it would be supported in the future as well as it had been in the past. A notion had got abroad that this was a school for architects. It was nothing of the sort. It was a school for all those who desired to be trained in technical art. This school must either go on flourishing or stop. There was no medium course, and unless the Corporation of the city of Edinburgh supported the school he did not see how it could be carried on at all. He felt sure that if the city would only show itself interested in this noble work they would be able to get some assistance from headquarters for the purpose of making it more efficient than it is now.

### TESSERÆ.

#### Coronation Records.

IN England, after the kingdoms of the Heptarchy had become united, we find the ceremony of coronation continually alluded to in the Saxon Chronicle, under the term *gehalzod*, by which is expressed that the king was hallowed or consecrated. Kingston-upon-Thames was the place where the Saxon sovereigns were crowned during nearly the whole of the tenth century. Edgar, who succeeded to the throne in 959, is said to have been crowned either at Kingston or at Bath. Edward the Confessor was crowned at Winchester in 1042. The copy of the gospels upon which the Saxon kings were sworn at their coronations is believed to be still preserved amongst the Cottonian Manuscripts in the British Museum, in the volume Tib. A. ii. Harold and William the Conqueror were crowned at Westminster. It was customary with the Norman kings to be crowned more than once. Henry II. crowned his eldest son and associated him with himself in the administration during his own life. In one or two instances in the Norman times we find the regnal years of our kings dated from their coronations only; the previous time, between the predecessor's death and the performance of the inaugural ceremony, was considered as an interregnum. This is a fact of no small importance to those who would accurately fix the dates of public instruments and transactions in the reigns of Richard I., John and their successors. The first English coronation of which we have any detailed account is that of Richard I., in the histories of Diceto and Brompton. An account of all the formalities observed at that of Richard II., taken from the Close Rolls, is to be found in Rymer's "*Fœdera*," the old edition, vol. vii. p. 157. Froissart has

given a short but interesting narrative of the coronation of Henry IV. The details of the English coronations of Henry V. and VI., and of the latter in France, are contained in the Cottonian Manuscripts, Tib. E. viii. and Nero C. ix. Hall and Grafton have described the ceremonies at the coronation of Richard III. The account of the coronation of Henry VIII. with the king's oath prefixed, interlined and altered with his own hand, is likewise preserved in the Cottonian Manuscript already mentioned, Tib. E. viii. The oath, with its interlineations, is engraved in facsimile in the first volume of the second series of Ellis's "*Original Letters illustrative of English History*." Fuller, in his "*Church History*," and Ellis's "*Letters*," 1st Ser., detail the particulars of the coronation of Charles I. Several editions of the Form and Order of Charles II.'s coronation at Scone in 1651 were published at the time in 4to at Aberdeen; reprinted at London in folio, 1660, and the entertainment of Charles II. in his passage through London to his coronation, with a narrative of the ceremony at the coronation, by John Ogilby, with plates by Hollar, folio, London, 1662. Sandford's "*History of the Coronation of James II.*," folio, London, 1687, illustrated with very numerous engravings, is the most complete of all our works upon English coronations published by authority. That of George IV., of which two portions only appeared, was far more splendid, with coloured plates, but remains unfinished. A very ancient MS. of the ceremonial of crowning the emperors at Aix-la-Chapelle was purchased at the last of the sales of Prince Talleyrand's libraries by the late Mrs. Banks, and is now among the manuscripts in the British Museum. Of foreign published coronations, that of Charles V. at Bologna as emperor, in 1530, is one of the most curious, engraved in a succession of plates upon a roll of considerable length. The "*Sacre de Louis XV., Roi de France et de Navarre, dans l'Eglise de Reims, Octobre 25, 1722*," is a work of pre-eminent splendour, full of finished engravings. The "*Description of the Ceremonies at the Coronation of Napoleon as Emperor of France, with his Consort Josephine, December 2, 1804*," is a work of equal size, but the engravings are chiefly in outline, folio, Paris, 1807. There is a volume, with engravings, of the coronation of the Empress Anne of Russia, folio, Petersburg, 1731, and many others might be enumerated. The formulary which has served as the general model for the English coronations since the time of Edward III. is the "*Liber Regalis*," deposited in the archives of the Dean and Chapter of Westminster, and kept with a religious care. It is supposed to have been written for the particular instructions of the prelates who attended at the coronation of King Richard II. and his queen. Copies of this manuscript, without its illuminations, are preserved in one or two libraries. The substance of the ceremonial directed in it is abridged in Strutt's "*Manners and Customs*," vol. i. p. 22-37.

#### Antique Crowns.

The earliest use of a crown is attributed to Janus Bifrons, the reputed inventor of ships and coinage, whence many coins of Greece, Italy and Sicily bear the head of Janus on one side and a ship or a crown on the reverse. Judging from Homer's silence, it does not appear to have been adopted amongst the Greeks of the heroic ages as a reward of merit, nor as a festive decoration, for it is not mentioned amongst the luxuries of the delicate Phæacians, nor of the suitors; but a golden crown decorates the head of Venus in the hymn to that goddess. The first introduction as an honorary reward is attributable to the athletic games, in some of which it was bestowed as a prize upon the victor, from whence it was adopted in the Roman circus. It was the only one contended for by the Spartans in their gymnastic contests, and was worn by them when going to battle. The Romans refined upon the practice of the Greeks and invented a great variety of crowns formed of different materials, each with a separate appellation and appropriated to a particular purpose. Golden crowns, without any particular designation, were frequently presented out of compliment by one individual to another, and by a general to a soldier who had in any way distinguished himself. The Greeks in general made but little use of crowns as rewards of valour in their earlier and better periods of their history, except as prizes in the athletic contests; but previous to the time of Alexander crowns of gold were profusely distributed, amongst the Athenians at least, for every trifling feat, whether civil, naval or military, which, though lavished without much discrimination as far as regards the character of the receiving parties, were still subjected to certain legal restrictions in respect of the time, place and mode in which they were conferred. They could not be presented but in the public assemblies, and with the consent, that is, by suffrage, of the people, or by the senators in their council, or by the tribes to their own members, or by the demotai to members of their own demos. According to the statement of Aeschines, the people could not lawfully present crowns in any place except in their assembly, nor the senators except in the senate-house, nor, according to the same authority, in the theatre, which is

however, denied by Demosthenes; nor at the public games, and if any crier there proclaimed the crowns he was subject to timia. Neither could any person holding an office receive a crown whilst he was *hypeuthunos*—that is, before he had passed his accounts. But crowns were sometimes presented by foreign cities to particular citizens. This, however, could not be done until the ambassadors from those cities had obtained permission from the people, and the party for whom the honour was intended had undergone a public investigation, in which the whole course of his life was submitted to a strict inquiry.

#### Leopold Cicognara.

After serving the State of Modena in many ways, Count Cicognara was in 1808 appointed president of the Academy of the Fine Arts at Venice; an office for which he was well qualified no less by the public-spirited zeal with which he discharged it than by his knowledge of art itself and the literature belonging to it. From this epoch in his life may be dated the commencement of his career as a writer, during which he enriched the literature of art by many important works. In 1808 he published a treatise on "The Beautiful" ("Il Bello"). This was succeeded by his great work, "The History of Modern Sculpture" ("Storia della Scultura dal suo risorgimento in Italia al Secolo di Napoleone"), an undertaking to which he had been urged by his friends Giordani, D'Agincourt and Schlegel. It is in three folio volumes, the first of which appeared in 1816 and the last in 1818, and contains about 180 outline plates, exhibiting a vast number of subjects from the earliest period—the age of the Pisani and Donatello—to that of Canova, to a notice of whose works the whole of the seventh or last book is devoted. Although fastidious criticism has taxed it with some defects, it is undeniably a performance of great research and erudition, bringing down to the present century the history of the art from the point at which it had been left by D'Agincourt, who himself had taken it up where Winckelmann had quitted it. Besides a vast body of information as to the professed subject, his work also embraces much subsidiary matter of great interest, particularly the descriptive and historical notices of St. Mark's at Venice, the cathedrals of Milan and Orvieto, St. Peter's and many other Basilicae. His next publication was a catalogue raisonné, in two thick 8vo volumes, of his own library, an immense collection of works in every department of the fine arts. This is a most valuable addition to bibliography, and shows that Cicognara spared no cost in the pursuit of his favourite studies. He likewise produced a work entitled "Memorie per servire alla Storia della Calcografia" and numerous articles relative to subjects of art and artists, printed in various journals, but never unfortunately given afterwards to the world in a collective form. Even had he produced none of the works above enumerated, the name of Cicognara would have been transmitted to posterity with honour by the two splendid architectural volumes, entitled "Le Fabbriche piùospicue di Venezia," 1815-20, of which the greater share of the literary part and the chief conduct of the work belong to him, although he was assisted in it by Diedo and Selva, who furnished the accounts of many of the buildings. It is illustrated with 250 engravings of the most interesting structures of Venice.

#### Saxon Building.

Our Saxon ancestors undoubtedly were far less skilled in architecture than those of succeeding ages; but it would be a mistake to suppose that their churches, even after the general adoption of stone and lime masonry, were mere rude, undorned structures. Those specimens of their workmanship which remain to the present day evince that they certainly paid some attention not only to ornament in general, but even to sculpture; witness the tower of Barnack Church, Northamptonshire, and Sompting Church, Sussex. We can scarcely imagine that while much intercourse was maintained with the continent, which assuredly was the case, art as then known and practised there was less cultivated in this country than at the same period in Ireland, and the researches of Petrie have efficiently established the fact that many of the ruins remaining in his country date much earlier than the Norman invasion of England, those edifices even now exhibiting much constructive skill, and in many instances proving the care and labour employed upon their adornment. But, in addition to any inferences we may draw, ancient writers actually bear testimony both to the opinion formed in their day of the early ecclesiastical edifices, and also to the attention and expense bestowed upon supplying them with whatever was considered necessary and appropriate for their sacred purposes. Thus Exham Church, built by Bishop Wilfrid, A.D. 674, is styled a "wonderful work, 'mirabile opus,'" and Ripon was indebted to the same munificent prelate for a highly commended church. His successor, Acca, is said to have added to his church various beauties and rare works: "ecclesiæ suæ edificium utilitatis decore ac mirificis ampliavit operibus." The following quotation of Professor Willis likewise will show the opinion upon this subject of a very competent judge:—"That

many of the Saxon churches were erected of stone, and on plans of great complexity, with crypts, triforia, clerestories, central towers, and other parts resembling in arrangement the Norman churches, can hardly be doubted from the descriptions that have been preserved to us."

#### The Etruscans.

The Etruscans in all civilising art were exceedingly in advance of the other nations of Italy. They belong, indeed, to the era of Phœnicia and of Egypt rather than of Greece, although in their later period they borrowed largely from the plastic skill of Corinth. Their tombs and their magnificent walls still testify to their luxury and industrial power. Their fleets commanded the seas, and their heavy-armed infantry were unmatched on the land before Rome existed as a city. Their nobles were priests, as often in Asia Minor; the ecclesiastical system was ancient and very peculiar, and the use of letters familiar to them in very early times. Their alphabet was a modification of the Phœnician, and what deserves remark, like all the people of western Asia, they wrote from right to left. Like the Egyptians, they loved to cover the inner walls of their tombs with painting, and besides, to stock them with valuable pottery and furniture to such an extent that the moderns, though knowing but a few words of their language, have recovered a surprising acquaintance with their daily life. "The internal history of Etruria," says Mr. Dennis, "is written on the mighty walls of her cities and on other architectural monuments, on her roads, her sewers, her tunnels, but above all in her sepulchres. It is to be read on graven rocks, and on the painted walls of tombs. But its chief chronicles are inscribed on sarcophagi and cinerary urns, on vases and goblets, on mirrors and other articles in bronze, and a thousand et cetera of personal adornment, and of domestic and warlike furniture—all found within the tombs of a people long passed away." We can have no doubt, therefore, of their high cultivation, and this gives zest to the question whether it was developed independently on Italian soil, or imported from Asia. Their alphabet, written from right to left, immediately suggests a direct transmission from the East, and the same conclusion follows the instant it is admitted that a place so near to the sea as Tarquinii is their mother city. That it was so all antiquity believed, and the very name is a strong attestation, for Tarquinii is merely another pronunciation of Turchina. Again, if the Etruscans had been a continental people who came from the North into Italy, they could scarcely have been confined to so very narrow an area, nor could they, while leaving infinite memorials of themselves within that small compass, leave none at all anywhere else. This consideration seems in itself decisive, if we are left to internal arguments.

#### Byzantine Painting.

It was in a century of decay and corruption that Constantinople became an imperial city; treasures for its embellishment were not wanting to its founder, but he could not prevent the bad taste of the period from leaving its impress everywhere; moreover the Greeks were indisputably the most degraded portion of his subjects, and the colonies of courtiers and adventurers attracted them from time to time by himself and his successors, could only have the effect of aggravating in a still greater degree the intellectual and moral evils of this wretched population. Christian art, it is true, became naturalised there, because the public belief created a popular demand for it; and we know that the walls of the churches and palaces were covered with paintings representing subjects drawn from the Old and New Testament, or the history of a martyr or some illustrious bishop, or even with landscapes, marine subjects and animals; we also know that in the reign of Honorius a Christian senator caused divers passages from the life of Christ to be painted on his toga, and that the number of figures distributed in the different groups amounted sometimes even to 600; and, lastly, we know that the youth of Antioch, who abandoned the schools rather than pay the smallest compensation to the philosophers and teachers of rhetoric, spent considerable sums in order to induce the painters, who passed their lives in the most scandalous excesses, to teach them the art of painting with rapidity. All these facts and many others of the same description, which at first sight seem to reveal a sort of enthusiasm for art in the Eastern empire, are, however, only deceitful appearances which vanish on an examination of the works which were produced from time to time by this miserable school. If, indeed, the Greek artist had known how to adopt and copy with fidelity the traditional compositions which came to him from Italy, and had thus shared with the latter a common existence, he might long have appropriated to himself all that distinguishes the paintings of the catacombs and early basilicas; but he seemed destined, on the contrary, to spoil all that he touched, and particularly the allegorical subjects so poetically invented by the pure imagination of the first Christians, and the abuse of allegory was carried so far that the Council of Constantinople held in 691, was obliged to interfere, in order to give a check

where the representation of Christ was concerned—a subject on which it was to be feared that the Greek mind would be tempted endlessly to refine.

#### Roman Villas.

There was no limit in the size and no regularity in the construction of a Roman villa. The opulent patrician indulged in many, spread over the fairest districts of Italy, in situations either adapted to the changes of the season and to the taste of the owner, or dictated by his caprice and the fashion of the times. The arcaded substruction of numerous ancient villas still remains, while the buildings above are in ruins, either by the depredations of those who in after ages demolished to erect other buildings, or by the silent waste of time on such as were erected of the soft tufa. On many of the Roman villas convents and monasteries were erected, as materials were at hand, and the arcades of the substructions formed conveniently storehouses and cellars. How long the Roman villas remained habitable after the many invasions of Italy is not easy to ascertain. One of the celebrated villas of Lucullus, formerly belonging to Marius, and afterwards an imperial residence of Tiberius, situated on the promontory of Misenum (Capo Miseno), existed in the year 480. To this retreat was sent, by the clemency of Odoacer, king of the Heruli Goths, the last feeble representative of the Roman emperors of the west, called in derision Augustulus. The villa had gradually been changed into a strong castle to protect it against the sea attacks of the Vandals. These invasions by sea of the Vandals, and subsequently of the Normans and Saracens, ruined probably the crowd of Roman villas on the Neapolitan shores. The villas on the fertile plains of Italy would suffer by the invasions by land; but many villa castles, or fortified residences, remained after the tenth century in the hilly districts of the Vicentine and Veronese territories, as their rural nobility descended into the cities of Padua, Verona, Vicenza and Treviso, and took part with the Guelph faction. In the thirteenth century 150 castles were computed to be in the Milanese. It was probably to a Roman villa that Avitus, lieutenant of the Emperor Maximus, and afterwards himself a short-lived emperor, retired in the year 460. It was situated near Clermont in Auvergne, on the margin of a lake, into which rushed a mountain torrent of cascades. The villa contained baths, summer and winter apartments and porticoes. Sidonius, the son-in-law of Avitus, has, in imitation of Pliny, given a prolix but obscure description of it.

#### Building Trades Exhibition.

SIR,—I should be much obliged if you would mention in your journal that the next Building Trades Exhibition takes place at the Royal Agricultural Hall from Saturday, June 13, 1903, and closes on Saturday, the 20th. Already the main portion of the ground floor has been allotted, so that immediate application should be made by intending exhibitors. It is also my intention to hold a colliery exhibition to immediately follow the building trades.—Yours faithfully,

June 20, 1902.

H. GREVILLE MONTGOMERY.

#### GENERAL.

A Meeting of the Royal Institute of British Architects was held on Monday. Mr. Emerson presided, and spoke about the excellence of the work of Mr. T. E. Collcutt, to whom the gold medal was presented. In reply Mr. Collcutt referred in feeling terms to the death of Mr. Bentley, who was originally selected for the distinction.

The Total Amount of the two days' sale in Paris of the Humbert collection of pictures was 1,187,000 francs.

The Municipal Council of Dieppe have resolved to change the name of the Rue de la Grève, and to call it after Alexandre Dumas, whose centenary will shortly be celebrated in France.

The Commission of Old Paris have arranged a competition for photographs of those parts of the city which are considered to be the most picturesque. Amateurs alone will be allowed to take part in it. The order of merit of the photographs will be determined by a jury of artists to be selected by the competitors.

The Senate of the London University having obtained a grant of 10,000*l.* a year from the London County Council have made the following among other appointments:—Professor Ramsay, F.R.S., appointed teacher of chemistry at University College; Professor Capper, appointed teacher of mechanical engineering at King's College; Professor Unwin, F.R.S., appointed teacher of civil and mechanical engineering at the Central Technical College.

The Bishop of Rochester consecrated on Saturday the new church of St. Andrew and St. Michael, which has been erected on a site in Greenwich Marshes, near the opening of the Blackwall Tunnel. The church has been built at a cost of 15,000*l.* The money was provided by the sale of the site and property of the church of St. Michael and All Angels, Wood Street, E.C., the font of which has been removed to the new church. At the east end is a stained-glass window in the shape of St. Michael's cross, subscribed for by the people of the parish, and outside the west door are two statues in stone of the two patron saints. The designs were prepared by Mr. Basil Champneys.

The President and Council of the Institution of Electrical Engineers will give a conversazione at the Natural History Museum, Cromwell Road, on Tuesday evening, July 1, to meet the members of the Incorporated Municipal Electrical Association and the foreign delegates to the International Tramways and Light Railways Congress.

The Salon prizes in money have been announced. The principal prize goes to M. Tardieu, painter, who exhibited a picture entitled *Labour*. The other prizes were awarded to M. Grosjean, sculptor, and M. Boutrou, architect. The travelling bourses for architecture have been won by MM. Brunet and Billerey.

The Council of the Society of Arts offer the Fothergill prize of 50*l.* and a silver medal for a paper on "Existing Laws, By-laws and Regulations relating to Protection from Fire, with Criticisms and Suggestions." The paper should consist of about 8,000 to 10,000 words, and be written with a view to its being read and discussed at an ordinary meeting of the Society. Papers submitted for the prize must be sent to the secretary on or before October 1, 1902.

The Luxembourg Museum has obtained from M. Benjamin-Constant's widow *La Justice du Chérif*, one of the most impressive of his pictures, with which he never would part. It is destined eventually to figure at the Louvre with the portrait of his son André, purchased after the Salon of 1896, when he obtained the medal of honour.

The French Cabinet have vetoed a proposed loan of 200,000,000 frs. by the Seine General Council on the ground that the programme includes the completion of the Boulevard Haussmann and the widening of a large number of streets, undertakings which should be defrayed by Paris and not by the Department of the Seine. The Government have expressed the opinion that loans ought not to go on indefinitely increasing, but that taxation should be resorted to.

The City of London (Streets) Bill, which, *inter alia*, authorises the Corporation to make by-laws regulating the demolition of buildings so as to prevent a nuisance, was passed by the Chairman of Committees of the House of Lords after formal proof had been given of the preamble.

A Memorial of the late Professor Merriam, professor of Greek Archaeology and Epigraphy in Columbia University, to be placed over his grave at Athens by the members of the Archaeological Institute of America, has been completed. The monument was designed by Mr. E. L. Tilton, the architect of the Argos excavations, who gave his services gratuitously.

A site for the sanatorium for consumption, which is associated with the King's name, has been purchased in Midhurst, Sussex.

M. Zariñ, of Marseilles, has presented to the Musée Carnavalet a study of M. Detaille's *Distribution of Flags*, containing portraits of various celebrities, including President Grévy, Gambetta, Léon Say, &c.

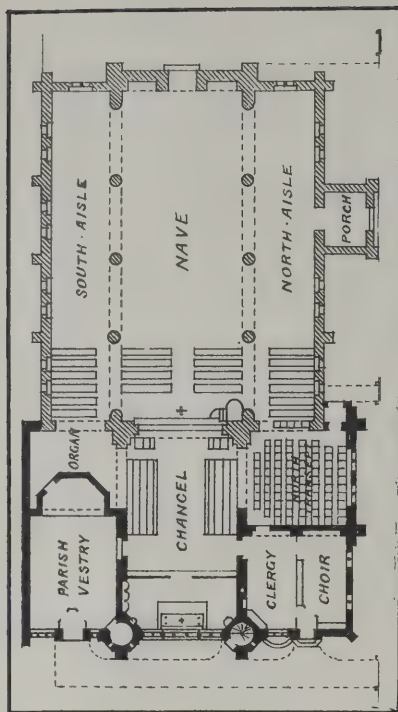

The Walker Engineering Laboratories, in connection with University College, Liverpool, have been enlarged by the addition of an annexe, consisting of a foundry fitted with a forge. The research laboratory has also been extended, and special scientific apparatus has been added for the advanced students. The cost of these extensions, which amounts to a considerable sum, is being borne by Sir John T. Brunner, M.P., Mr. E. K. Muspratt, Mr. C. W. Jones and Mr. R. Rathbone.

The Foundation-stone of the new St. Matthew's Church, Auckland (N.Z.), was recently laid. The edifice is to be built of Oamaru stone, and will cost 30,000*l.* It will provide seating accommodation for 1,000 worshippers, and is expected to be the finest church in the colony, though not quite so large as Christchurch Cathedral. The contract stipulates that the church be completed within three years.

The Architect, June 27<sup>th</sup> 1902.

THE

## Architect and Contract Reporter.

## NOTICE.

The publication of THE ARCHITECT on Wednesday, the 25th, instead of on the 27th inst., was announced some weeks back. The priority of date was rendered necessary owing to the celebration of His Majesty's Coronation. On Tuesday the lamentable announcement of the King's illness has changed the character of the week, and regret has supplanted the national joy. Owing to the arrangements entered into we are obliged to publish THE ARCHITECT at the time arranged.

ARCHITECT OFFICE:

3.0 p.m. on Tuesday.

## TENDERS, ETC.

\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

COOMBE HILL, NEAR AYLESBURY.—July 19.—Designs are invited for the Bucks War Memorial (a stone monument 50 feet high). Mr. R. J. Thomas, M.I.C.E., County Hall, Aylesbury.

DEPTFORD.—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100%, 75%, and 50% are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

INDIA.—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

LIVERPOOL.—Sept. 15.—Designs are invited or new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250%, 150%, and 100% respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

SOUTHEND.—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

SUNDERLAND.—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100%, 50%, and 25% are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

TOTTENHAM.—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200%, 100%, and 50% are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

WEST HARTLEPOOL.—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75% and 35% respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

sary to extend their studios and largely increase their staff at 58 Farringdon Street.

THE Rev. Fras. Grant-James, M.A., vicar of Marske-by-Sea, Yorkshire, and chairman of the restoration committee, has given instructions to Messrs. Wm. Potts & Sons, clock manufacturers; Leeds, to make and fix a new Cambridge quarter-chime clock, with four illuminated dials, to replace the fine clock recently destroyed by fire, and made by the firm, who also manufactured the clock presented to Houghton Church, Carlisle, by Mrs. Fell, of The Knells, Carlisle, sister of Lord Grimthorpe, which was set going on Sunday last.

MESSRS. EASTON & COMPANY, LTD., successors to Easton, Anderson & Goolden, Ltd., engineers, Broad Sanctuary Chambers, S.W., inform us that they have appointed Messrs. Reunert & Lenz, of Johannesburg and elsewhere, sole agents for the whole of South Africa for the sale of the Schmidt patent superheaters, and also for the sale throughout the same territory, except Cape Colony, of their electric and hydraulic lifts. In future, therefore, all communications with regard to either superheaters or lifts for the districts in question should be addressed either to Messrs. Reunert & Lenz, or to their London representatives, Messrs. Findlay, Durham & Brodie, of 110 Cannon Street, E.C. Messrs. Easton & Co. also mention that they have engaged Mr. Francis G. Cowdrick, of 37 West Dulwich Mansions, S.E., as their representative for the South of England.

#### BUILDING AND BUILDERS.

CONSIDERABLE alterations are being made to the Church schools at New Barnet; the architect is Mr. F. Child, of Chancery Lane, E.C.

IT has been decided to erect a tablet in the London Stock Exchange in memory of those members who have fallen in the late war in South Africa.

MESSRS. GORDON & GUNTON, of Finsbury House, Blomfield Street, London, are the architects for the new Wesleyan church and schools which are being erected at Petersfield.

A COUPLE of houses in Canal Road, Armley, collapsed, and the nine men who were working about the premises—engaged in converting them into lock-up shops—ran for their lives. Nobody was injured.

THE foundation-stone of a new building designed to meet the growing needs of the Church at Beeston Hill was laid on

the 21st inst. The new church, which is to cost 4,500*l.*, will adjoin the old one erected some twenty-six years ago on the low side of Cemetery Road, near Elland Road.

AT Hinton, Northants, the foundation-stone was laid on the 17th inst. of a new Wesleyan chapel which is to cost 1,250*l.*, to seat 270 people, and is so arranged that extensions can be made to accommodate 120 more. The contract has been placed in the hands of Mr. G. Johnson, builder, Hinton.

THE foundation-stone of the buildings in connection with the school-chapel at Felsted was laid on the 19th inst. These when finished will consist of a big school and eight classrooms, of which the classrooms are nearly completed. The foundations of the big school have been laid, and the whole building will be finished as soon as the necessary funds have been obtained. The new block was designed by Sir Arthur Blomfield & Sons, the builders being Messrs. Hunt, of Hoddesdon.

ON Friday last, in the Lord Mayor's Court, before the Common Serjeant, Mr. Bosanquet, K.C., and a jury, the case of compensation for damage to the premises of Messrs. D'Almaine in consequence of a settlement alleged to be caused by the building of the Great Northern and City Railway Company was part heard, but before the whole case had been opened a settlement was arranged by which the plaintiffs receive the sum of 450*l.* as compensation. The counsel engaged were Mr. Dickens, K.C. and Mr. Stevenson for the claimants, and Mr. McCall, K.C. and Mr. Cave for the railway company.

THE water committee of the Birmingham City Council had before them on the 20th inst., at a meeting presided over by Alderman Lawley Parker, a set of plans showing the complicated details which have to be worked out in the construction of a valve tower which is being provided for the new water-works. This tower will contain the apparatus for regulating the flow of water from the reservoir at the Elan Valley into the aqueduct. The plans, which number about a dozen, are very elaborate and minute, and they illustrate the construction of the various sections of the ironwork. Without taking into consideration the expense of the erection of the tower, the ironwork alone costs about 6,000*l.*

AT a meeting of Walsall Board of Guardians a long discussion took place on a recommendation by the building committee that the old board-room at the workhouse be demolished in order to admit light and fresh air to the other buildings. Against this several members urged that the workhouse was at

- LA ROCHELLE (HOTEL DE VILLE).

present so cramped that if any of the existing accommodation was dispensed with it might result in the Local Government Board pressing for the erection without further loss of time of an entirely new workhouse. Mr. Yardley, however, said the matter had been mentioned to Mr. Wethered, Local Government Board inspector, who entirely approved of what it was proposed to do. The committee's recommendation was approved by eleven votes to eight.

VARIETIES.

THE new St. Andrew's United Free Church, Blairgowrie, was opened last week. It is built in the Early English Gothic style, with seating accommodation for over 900, and, with the halls, will cost about 7,000.

AT the engineering works of Messrs. Goddard, Massey & Warner at Nottingham a casting was being moved by a crane when the chain slipped, and the enormous weight fell on a young man named Edward Tatton, who was crushed to death.

IN the course of some repairs at one of the poor houses at Helpringham, near Sleaford, it was discovered that the floor bricks of the house were forced up by a large root of an elm tree growing in a garden 10 feet away. It penetrated under the path, under the wall and under the floor of the house, and into an adjoining garden, extending in all some 40 feet.

THE gable and part of the roof of an old house at the junction of Exchequer Row and Castle Street, Aberdeen, has fallen in. The house was about to be pulled down in connection with city improvements. There have been no tenants in it for some time. The premises were at one time known as the Bursars' hotel. The adjoining property to the west has just

been removed as part of the improvement scheme in the Exchequer Row area.

AMONG the improvements now being carried out in Ripon Cathedral are new stalls for the clergy and choir in the nave. These have been designed by Mr. J. Oldrid Scott, and the work has been carried out by Messrs. Thompson & Son, of Peterborough. The stalls are in wainscot oak, and are elaborately carved with tracery in front, and carved bench ends. The book-boards are designed in canopy form, the fronts having groined carving. A new lobby is being erected for the west doors, this also being in wainscot oak, with suitable carving.

THE first summer excursion of the Berks Archaeological Society for the present session took place on the 18th inst., when the itinerary was one of peculiar interest, comprising visits to Westbury, the White Horse and Bratton Castle, Edington (where luncheon was taken in the monastery garden), Keevil, Potterne and Devizes. Before leaving Devizes the party, which was a large one, was entertained to a meat tea on the kind invitation of the president (Mr. C. E. Keyser, M.A., F.S.A., of Aldermaston Court). The President acted as cicerone during the day, and himself described the picturesque church of Bratton, the fine Decorated church of Edington, the fifteenth-century church of Steeple Ashton, and the noble Early English church at Potterne. The day was fine, and the excursion was much enjoyed.

AT a special meeting of the Council of the Society of Architects, held on the 19th inst., the president, Mr. Silvanus Trevail, F.R.I.B.A., in the chair, the resolution passed at a meeting of the Council of the Royal Institute of Architects of Ireland on the 2nd inst. was considered. It was unanimously resolved that the sympathy of this Council be tendered to the Royal Institute of the Architects of Ireland in the attitude they have taken on the subject of the proposed selection of an architect by His Majesty's Treasury for the erection of the College of Science in Dublin, and it is the opinion of this Council that for an Irish work of this national character an Irish architect should be solely employed. It was further resolved that a copy of this resolution be forwarded to the First Lord of the Treasury.

AT the Town Hall, Dudley, Lieutenant-Colonel A. C. Smith, R.E., on behalf of the Local Government Board, held an inquiry on the 19th inst. relative to the application of the Town Council for sanction to borrow 2,613*l.* for public requirements

and improvements. Among those present were Alderman G. H. Dunn, Messrs. H. C. Brettell, town clerk; J. Morris, deputy town clerk; J. Gammage, borough surveyor; A. W. Harley, borough accountant. The town clerk explained that the annual assessable value of the borough was 121,674*l.*, and the debt on the general district rate fund was 127,938*l.* including 39,174*l.* for electric-lighting purposes. Sanction for a loan of 10,721*l.* had been given, but the money had not yet been borrowed. The Council had also made application in respect of a further loan of 22,000*l.* for electric-lighting purposes, and an inquiry had been held, but the necessary permission for borrowing the amount had not yet been received. The 2,613*l.* which the Town Council now applied for sanction to borrow was made up as follows:—247*l.* for the purchase of a new Lancashire boiler at the public baths, 126*l.* for the provision of a scarifier which would be attached to one of the steam-rollers, 1,240*l.* for works of sewerage and street improvement in various parts of the borough and 1,000*l.* for the extension of the Grange Park by over five acres. Evidence having been given by the borough surveyor, the inquiry concluded.

A MEETING of the Aberdeen Public Library committee was held recently. Plans for the erection of a new reading-room at the central buildings and a branch reading-room at Torry were submitted. Considerable discussion took place over the question of the greatly increased expense that would be involved by the new plans. It was stated that whereas when the original plans were drawn up it was estimated that the extension of the central buildings and the erection of two branch reading-rooms would cost 6,000*l.*, the estimated cost of the central extension would alone amount to nearly 7,000*l.* Mr. William Johnston remarked that when Mr. Carnegie was communicated with on the subject, they had submitted plans to him estimating the cost of the new buildings at 6,000*l.*, and it was on that understanding that Mr. Carnegie had given a donation to cover the entire cost. As honourable men, he thought they should place the matter before Mr. Carnegie, and inform him how matters stood. It was eventually agreed to submit the whole position to Mr. Carnegie, and await his reply before proceeding further in the matter.

A NEW athletic pavilion, erected by Messrs. Cadbury Brothers, and presented by that firm as a Coronation gift to the Bourneville Athletic Club, has been formally opened. The new pavilion is built of brick in the picturesque half-timber style, and is erected on the bank of the south side of the Men's

Recreation Ground, which was opened in the spring of 1890 and handed over by Messrs. Cadbury to a body of trustees, to be used for purposes of recreation by the male employees of the firm. Should the firm at any time discontinue business the trust deed arranges for the ground to be taken over by the local authority, and to be retained as an open space for recreative purposes for all future time. An exactly similar arrangement is made in reference to the recreation ground used by the female employees of the firm, and Mr. George Cadbury intimated that the pavilion was given under similar conditions. It is a commodious and well-appointed building. The first floor contains a large luncheon room and refreshment bar, with kitchen accommodation; also two dressing rooms, lavatories and shower baths. A verandah overlooking the ground runs the whole length of the building, 60 feet. On the second floor there is a gymnasium, 60 feet by 40 feet, fitted up with all necessary appliances. From the gymnasium entrance is gained to a balcony 45 feet long, while at the north-west corner of the pavilion there is an octagonal tower which adds considerably to the appearance of the building. In the basement, which is on a level with the playing field, there are professionals' room, tool-house, heating-chamber and cellars. Entrance is gained from the ground to the verandah of the pavilion by two flights of stone steps.

THE land agents' committee of the Surveyors' Institution, Irish Branch, met on the 19th inst. at their offices, 110 Grafton Street, Dublin. Major H. G. S. Alexander, F.S.I., chairman of the Irish Branch, presided, and there were present Messrs. G. F. Stewart, D.L., Toler R. Garvey, J.P., W. D. Talbot, Crosbie, Charles Dickenson and A. B. Watson, LL.B., secretary. The minutes of the last meeting having been read and confirmed, questions affecting the position of receivers in connection with sales under the Purchase Acts in Land Judges Courts occupied the committee, and satisfaction was expressed with the favourable replies given by Judge Ross to the representations made him on this subject by a recent deputation. Communications by members on questions of difficulty arising out of the Land Acts, Purchase Acts and Local Government Acts were next submitted and dealt with. Of the other business before the meeting the conditions governing the election of land valuers, architects and engineers to membership were considered, the membership in Ireland and the diploma of the Surveyors' Institution being now open to these professions. Applications for election to membership from successful candidates at this year's examinations were passed. An address to

the King on the occasion of the Coronation was decided upon, and the committee adjourned.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on Thursday, the 19th inst., at the Society's house, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. There were also present Viscount Clifden, Lieut-Colonel the Hon. G. H. W. Windsor-Clive; the Revs. Canon J. Allen, D.D., Canon J. Erskine Clarke, S. A. Donaldson, A. G. Ingram and Prebendary C. J. Ridgeway; Messrs. A. Baldwin, M.P., E. Lee-Warner, H. W. Mozley, C. K. Norman, J. E. Ollivant, F. H. Rivington, W. E. M. Tomlinson, M.P., and the Rev. W. B. L. Hopkins, secretary. Grants of money were made in aid of the following objects, viz.:—Building new churches at Weston-super-Mare, All Saints, 240*l.* in lieu of former grant of 200*l.*; Blackham, All Saints, in the parish of Withyan, near Tunbridge Wells, 40*l.*; Fulham, Christ Church, Middlesex, 100*l.*; and Goodmayes, St. Paul, in the parish of Chadwell Heath, Essex, 40*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Godney, Holy Trinity, near Wells, Somerset, 25*l.*; Hemblington, All Saints, near Norwich, 30*l.*; North Stoke, St. Mary, near Wallingford, Oxon, 25*l.*; Princetown, St. Michael, Devon, 60*l.*; Saltfleetby, All Saints, near Louth, Lincs, 10*l.*; and Snargate, St. Dunstan, near Folkestone, 15*l.* A grant was also made from the special Mission Buildings Fund towards building a mission church in the parish of Weaste, near Manchester, 40*l.* The following grants were also paid for works completed:—Goole, St. Paul, Yorks, 60*l.* on account of a grant of 100*l.*; Mexborough, St. George, Rotherham, Yorks, 50*l.*; Clapham, St. Peter, Surrey, 70*l.*; and Peterborough, St. Barnabas, 130*l.* In addition to this the sum of 202*l.* was paid towards the repairs of twelve churches from trust funds held by the Society.

THE new Britannia Pier at Yarmouth, which has been erected at a cost of 70,000*l.*, was formally opened on Saturday last. It has been erected opposite the main thoroughfare to the beach, Regent Road, and on either side of the entrance are tastefully laid-out gardens. The pier, which is 810 feet in length from the entrance gates to the head of the landing stage, has cost 70,000*l.* It is 125 feet longer than the old pier, and is 45 feet in width, extended by ornamental bays to 55 feet, and upon reaching the pavilion it expands to a width of 144 feet and continues thus for 200 feet. At the head of the pier there is a fine landing stage, 16 feet wide by 165 feet long, from

which sea trips will be run. For the greater part of its length the pier is carried on steel screw piles with girder supports, all braced together, and at the landing stage head, where much deeper water was met, logs of Australian Karri wood, 50 feet to 70 feet in length, have been used. Each of these huge logs has a weight of between three and four tons. No fewer than 104 steel piles are used in the pier, and they are screwed to an average depth of 15 feet, and 200 wood logs, which have been driven to an average depth of 22 feet. The pavilion, which is so prominent a feature of the new structure, has been built by Messrs. Boulton & Paul, of Norwich, at a cost of about 15,000*l.* It is a lofty edifice, surmounted with both dome and turrets, and has interior and exterior balconies. The walls and ceilings have been tastefully decorated with ornamental plastic work. There will be seating accommodation in the pavilion for upwards of 2,000 people, while it is estimated that the building will easily hold 3,000. A commodious stage has been erected. From the balcony running outside the promenade an admirable view of the surrounding scenery is to be obtained. Refreshment and tea rooms have been provided. Shelter accommodation has also been secured, to meet the exigencies of the weather. The contractors for the pier were the Widnes Foundry Co., and the engineers Messrs. Mayoh & Haley, of London.

At Scarning, in Norfolk, on the 18th inst. a pleasing ceremony inaugurated a new parish hall which forms part of a scheme whereby the village would be provided with a substantial parish hall or public room where all classes could spend their evenings in rational amusement, where a small library could be provided, where newspapers and periodicals could be perused, and where would be found all the comforts of a good club. The scheme also included the erection of four model cottages, to be let at a low rent, the proceeds to go to the maintenance and upkeep of the hall, and when the first part of the happy scheme has been accomplished the parish would be next furnished with five or six almshouses as homes for those who had earned their livelihood by honest labour while they could, and who, through no fault of their own, had become unable to do so in their old age. The hall and the model cottages have now been erected, and the former was formally opened on the date named. It is substantially built of red brick, supported by red-brick piers or buttresses; it has a high-pitched roof, and is capitolly lighted by large leaded windows. The hall proper is most commodious and well arranged—it is in length 40½ feet and in

breadth  $27\frac{1}{2}$  feet, the height to the ceiling being 15 feet. By a folding partition the hall is readily converted into two rooms, but this partition is easily moved back when the whole hall is required. At the east end is a small gallery which can be used for an orchestra or choir. There are also committee-rooms and suitable offices attached. One of the features, however, is the kitchen, which has been fitted up with all modern culinary conveniences, and will doubtless prove a great boon when dinners or teas have to be provided for public gatherings. On either side of the hall are built two capital model cottages, which will be let and the rent applied to the maintenance of the hall. Mr. W. J. Larner, of Dereham, was the builder, and Messrs. E. Boardman & Son, of Norwich, the architects.

IN a competition for a statue of the late Alderman John Lucas, to commemorate his services to the borough of Gateshead, the committee have selected the design submitted by Mr. W. Grant Stevenson, R.S.A., Edinburgh. The model represents the late alderman in his mayor's civic robe, part of which, lying over the right arm, affords an opportunity for giving a dignified outline to the figure. The left arm hangs easily by the side, while the hand pushes back the cloak, giving further variety to the drapery. The statue, which is to be life-size in bronze, is to be placed in the town hall, Gateshead.

### ELECTRIC NOTE.

IMPORTANT extensions to the Corporation's electric-light works were inaugurated at Taunton on Monday last. Taunton was the first town in the United Kingdom to adopt a system of public lighting by electricity. The works have now been brought thoroughly up to date at a cost of 18,000*l.*, and the capacity of the station is 1,600 horse-power. The inaugural proceedings included an "At home," followed by a banquet.

### BRISTOL BUILDING TRADE DISPUTE.

ON the 21st inst. Mr. A. A. Hudson, K.C., acting for the Board of Trade, had a private conference with representatives of Bristol builders and of various operative societies with a view to the settlement of differences which had recently arisen. The Bristol Master Builders' Association had served notices upon sundry operative societies in the building trade for certain alterations in the rules to come into effect on the 30th inst. Thereupon a conference was held between the various organisa-

tions concerned, but no amicable arrangement could be arrived at, and application was consequently made to the Board of Trade to appoint a conciliator under the Trade Disputes' Act. Preliminaries having been arranged, Mr. Hudson attended at the office of the Chamber of Commerce, and submitted the various documents that had been received by the Board of Trade from the Master Builders' and Operatives Societies.

The representatives at the Conference were as follows:—Master Builders' Society: Messrs. George Wilkins, A. Dowling, F. N. Cowlin, R. F. Ridd, E. Walters, J. Lovell, and H. J. Spear, secretary. Amalgamated Society of Carpenters: Messrs. E. H. Jarvis and G. H. Vorsey. General Union of Carpenters: Mr. F. Peters. Labourers' Society: Messrs. H. Brabham and J. B. Beckerton. Amalgamated Society of Painters: Messrs. F. Clothier and Timpson. City of Bristol Painters' Operative Society: Messrs. T. W. Davies and J. Langley. Plasterers' Society: Messrs. A. Wilmot and H. Davis. Plumbers: Messrs. E. Cram and P. N. Biggs.

Mr. George Wilkins opened the case for the Masters' Society, and detailed the reasons for the notice given to the operatives, more especially with regard to the wages.

Mr. Cowlin supported Mr. Wilkins's statement, and mentioned that in 1899 a halfpenny per hour advance was granted without discussion, but at present the labour market was full and the rate of wages very high, the consequence being that speculative building was practically at a standstill.

Mr. Jarvis replied on behalf of the operatives generally, leaving points affecting particular trades to be dealt with by the representatives of those trades.

In the course of the explanations that followed there was an opinion generally expressed that many jobs were hanging fire waiting until this dispute was settled, and that there were great prospects of a prosperous time in the near future. Messrs. H. Davis, G. H. Vorsey and F. Clothier all endorsed the contention of Mr. Jarvis.

The Conciliator then intimated that he considered it would be very unwise to dislocate the rule as to wages.

After further discussion, the Masters' Society representatives concurred with Mr. Hudson's view.

Mr. Hudson also explained that he considered the employers, when they gave notice in December last, were quite justified in doing so, considering the state trade was in at that time; then the war showed no prospect of early settlement, and things did not look very hopeful as far as the near future was concerned. But undoubtedly trade had revived, and the

look was more hopeful than it was expected to have been. He considered the operatives had made out a case for no reduction of wages taking place, and he complimented Mr. Jarvis upon the able statement he made of the operatives' case. This was of so lucid a character that it convinced him that the operatives were fully justified in resisting any reduction of their wages.

Notices served by the Masters' Society and certain other notices of alteration of various rules were, after full discussion, withdrawn. One of the representatives of the Amalgamated Society of Carpenters agreed to submit a proposal for the withdrawal of that Society's counter notice to a meeting of his committee, in order that advice of the conciliator might be accepted.

Upon the motion of Mr. Wilkins, seconded by Mr. Jarvis and supported by Mr. Cowlin, those present heartily thanked Mr. Hudson for his helpful services. Mr. Hudson, in response, expressed pleasure that he had been instrumental in bringing the two parties to an understanding, and alluded to the interesting circumstance that his first arbitration was in Bristol, and he looked back with pride to the fact that he was able on that occasion to bring about a satisfactory conclusion to the dispute.

### THE THORESBY SOCIETY.

MEMBERS of this Society had an enjoyable excursion on Saturday. A party of about fifty, including lady friends, journeyed by train from Leeds to Gilling, drove thence *via* ampleforth to Byland Abbey, and afterwards proceeded to Coxwold. Mr. Edmund Wilson, president of the Society, was of the party. The object was to visit interesting ruins in the district.

Gilling Castle, consisting of a basement storey of fourteenth-century work, being the remains of a fortified manor house, and of a superstructure of late sixteenth-century and early eighteenth-century work, was first visited. The great parlour, built by Sir William Fairfax between 1580 and 1585, is perhaps the finest Elizabethan room extant. Panelled in oak, its windows are filled with magnificent glass displaying the arms of the Fairfaxes, the Stapletons and the Constables, and there is a no less interesting contemporary frieze bearing the arms of all the leading Yorkshire families, arranged in wapentakes. The castle was described by Mr. John Bilson, F.S.A., the leading authority on the ancient structure.

Having inspected Gilling Church, the party drove to Byland. Here the chief attraction was the Cistercian abbey, founded during the reign of Stephen. The ruins, which are exceedingly interesting, were described by Mr. Sydney Kitson. Proceeding thence to Cotswold, tea was taken at the Fauconberg Arms, and the church was afterwards visited, the Rev. Ernest Hedger, rector, explaining the monuments of the Fauconberg family. Of the seventeenth century, these included the monument of the Lord Fauconberg who married Cromwell's daughter.

The party also inspected the Old Hall, formerly the Grammar School, built in 1610 by Sir John Hart, who was a native of Coxwold. As a poor lad he went to London and there made his fortune, and he showed his interest in the village by erecting the school. The last place visited was Shandy Hall, a seventeenth-century house, where Laurence Sterne lived and where he wrote "Tristram Shandy."

### CORONATION ILLUMINATIONS ON THE E.L.B. SYSTEM.

THE enormous output of illumination material and devices on the E.L.B. System, which far and away exceeded even the most sanguine expectations of the Electric-Lighting Boards Companies, has made it a matter of interest to find out where the System has been applied by the various supply houses and contractors through whose hands the E.L.B. material has passed.

In the first place, H.M. Office of Works has been using the E.L.B. System for part of the work at Westminster Abbey. Next, we find the E.L.B. System applied throughout the Stock Exchange, then over the great façades of the Prudential Insurance Company and the Gresham Insurance Company. Of clubs we noticed the United Service Club, the Conservative Club and the Devonshire Club adopting the E.L.B. System. Passing along the Embankment, we found an extensive display in the Temple Gardens.

Again, in the West End an exceedingly elaborate and clever display of the System is on the Hippodrome building, another on Messrs. Marshall & Snelgrove's big frontages, and another at Messrs. Liberty, in Regent Street. Looking over the various banking houses, we noticed Lloyds Bank and Martin's Bank equipped with this System.

Further, there are endless devices on the E.L.B. System

applied to ordinary business premises in the City, in the West End, and also on quite a number of private residences in Mayfair.

It has been interesting to observe how the prejudiced contractor and wireman (after much opposition), when pressed to do the work rapidly, eventually appreciated its advantages and the contractor suddenly found its labour-saving qualities. It was also curious to observe how certain contractors were able to appreciate the facility with which the System could be applied to all kinds of purposes, notably Messrs. Drake & Gorham, who used the material considerably, and the engineers of the aforesaid Hippodrome.

### THE BUILDING TRADES' GIFT TO THE NATION.

A FIRM of builders' merchants have written to the *Times* as follows:—"We notice letters to the press regarding cottage homes for the soldiers on their return from South Africa. We think it would be generally interesting to know what has become of the plan of the 'Building Trades' Gift to the Nation,' regarding which a great deal was heard in the early part of 1900, and in respect of which free gifts, we believe to a considerable extent, were promised, a proportion having been actually delivered. Part of such material has been used; we believe we are right in saying that a lot more has not been used, and that the work is at a complete standstill. Possibly some of those who devoted their time to the furtherance and carrying on of this project will explain through your columns the cause of the delay in proceeding with the work, and when, if at all, it is intended to complete the scheme; in the alternative, what it is proposed should be done with the material that has been presented and not used, and with the buildings partially erected."

### BUILDING BYE-LAWS IN HANDSWORTH.

IN Handsworth, one of the Birmingham suburbs, building bye-laws have to be respected. The following report from the *Birmingham Daily Post* of a single day's proceedings will show the vigour of the action displayed by the Urban District Council against local builders for alleged contravention of the bye-laws.

Evan Thomas, of Hamilton Road, Handsworth, carrying

on the business of a builder and contractor in Carpenter Road, as Evan Thomas & Sons, was summoned for not depositing a plan, in accordance with the bye-laws, of son stables which he had erected. Mr. Ernest Ward, assistant clerk to the Handsworth District Council, prosecuted, and Mr. Norton defended.

Mr. Ward said two brick stables had been erected at the back of a house in Leslie Road, which led off the Wellington Road, on the site of what was once the Aston Villa football ground.

Mr. Norton admitted he was in fault, and was prepared to plead guilty to this case.

Mr. Ward remarked that they were taking the proceedings under Bye-law 29, which required every person to deposit plans of any proposed new building. In this instance no plans were deposited.

Harry Martin, building inspector for the Handsworth Urban District Council, said he went with Mr. Richardson on April 16 to inspect some houses belonging to the defendant in Leslie Road. In the yard at the rear of the house were two stables, which had not been erected in accordance with the bye-laws. The plans for these stables were received on May 2, and it was pointed out where they were not in accord with the bye-laws. On June 17 he again inspected the place, and found nothing had been done to remedy the defect.

By Mr. Norton: Plans were deposited after the stables were erected. They were considered on May 6, and disapproved of. An intimation to that effect was sent to the defendant. There was a drain in connection with the stable which was not in accordance with the bye-laws.

Mr. Norton contended that his client had committed a purely technical offence. The bye-laws were extremely minute, and difficult for any person, even with the best possible intentions, to follow. In regard to the drain, he had no doubt his client would undertake to have it put right as soon as practicable. The building might not comply with the strict regulations of the bye-laws, but it had not been suggested that it was a public nuisance or a detriment to the neighbourhood, and he thought justice would be met by a nominal penalty.

Mr. Ward observed the bye-laws were only similar to those in universal force.

The Chairman remarked that plans should have been deposited with the authority charged with the maintenance and promotion of the public health, and the Bench could not do less than impose the full penalty of 5% and costs, 10s.

WM. E. PECK & Co.

8, BRADFORD AVENUE,  
LONDON, E.C.

Defendant was then summoned under the Council bye-laws for erecting a shed of material other than of bricks, stones, or other hard and incombustible substances.

Mr. Ward stated a shed had been erected in the yard of wood and corrugated iron, whereas the bye-law read, "Every person constructing a new building shall construct every external wall of brick, stone, or other hard incombustible substances."

John Grimley, a cab proprietor, of 4 Leslie Road, was subpoenaed to give evidence. He said he was a tenant of Mr. Thomas. The shed was an open one. It consisted of upright poles placed there by defendant, and witness added the corrugated iron roof. There were no boards at the sides or in front.

Harry Martin, building inspector, deposed it was a lean-to shed, and when he saw it on May 14 the end nearest the stable and one of the front lays were boarded up. He served notice to take the shed down, but the notice was not complied with.

Mr. Richardson, surveyor, said he had to survey the building over an 8-foot fence, as he could not get through to the yard.

Mr. Norton contended there was no case to answer, and that the shed could not in any sense be termed a building within the meaning of the bye-laws.

The Chairman said the Bench was clearly of opinion that the building in question was a new building, and that a part of the wall was of wood. Defendant would be fined 3*l.* and costs.

John Davies, 111 Murdoch Road, Handsworth, was summoned for erecting houses in Hamilton Road, on the Farcroft estate, without having submitted plans to the Urban Council. Mr. Ward stated that plans had been deposited of a house intended to be built, but the plans had been departed from. Consequently they had not built the houses on the plans as deposited, and the bye-law on the subject had been evaded. Mr. Hazel defended. The magistrates found that the defendant had complied with the bye-laws in depositing plans, and dismissed the case.

Defendant was then summoned for not "properly bonding and solidly putting together every brick wall with good mortar or cement as required by the bye-laws." Evidence of a technical nature was given by Harry Martin, the building inspector, the defendant, and a man in his employment. The Bench inflicted a fine of 3*l.* and costs.

Sidney John Davies, Soho Pool, Hockley, was summoned for an offence under the bye-laws in respect of two houses in

Regent Road. Evidence was given that a wall of the bedroom over the kitchen was only 4½ inches in thickness as against 9 inches required by the bye-laws. The plan deposited showed that the wall in question would be 9 inches thick.

Mr. Hazel explained that the work had been sub-contracted for, and it was not his client's fault that the wall was only 4½ inches in thickness. Fined 3*l.* and costs, 8*s.* 6*d.*

Humphrey Roberts, of Farcroft Avenue, was summoned for using bad mortar in the building of eleven houses on the Farcroft estate. Harry Martin, building inspector, deposed that when he went to the buildings some very inferior mortar was being used. He stopped while they made some better mortar. On a second visit he took a sample of the mortar, and it "consisted largely of garden soil." Mr. Sylvester, borough analyst, West Bromwich, stated he analysed a sample of the mortar. It was very bad, and there was a deficiency of lime.

Mr. Hazel called the defendant, who explained how the mortar came to be made. The building had now been done to the satisfaction of the building surveyor. Fined 3*l.* and costs, 1*l.* 11*s.* 6*d.*, including the analyst's fee. There were two other summonses against the defendant, but they were adjourned for a fortnight, defendant agreeing to pay the costs and carry out the work in accordance with the bye-laws.

George Gee, Brunswick Road, Handsworth, was summoned for not depositing plans, and for using other materials than provided for in the bye-laws. Defendant pleaded guilty to not depositing plans, and was fined 5*l.* and costs, 8*s.* 6*d.* The second case was adjourned for a fortnight to allow of defendant complying with the bye-laws.

## STEAM AND HOT-WATER HEATING ON THE AMERICAN SYSTEM.

WE have received from the Wolff Dryer Company, of 89 and 91 Sumner Street, Southwark, S.E., their new illustrated catalogue of steam and hot-water heating apparatus, which forms an interesting little guide book on the subject that will, as occasion arises, be found useful for reference. Members of the firm in question have, we are informed, made the science of heating and warming their principal study, extending over a very long period, and having devoted their entire time to the subject in the United States, they are in a position to give anyone consulting them the benefit of their experience in carrying

out heating installations with the view of securing the utmost efficiency at the least possible cost.

For heating public buildings, such as churches, schools, unions, theatres, hospitals, libraries, &c., low-pressure steam on the circuit-pipe system is advocated, and in a well-designed and balanced apparatus there is but little chance of mishap of any kind. Just what is requisite for any particular building to effect a successful system of heating, either by steam or hot water, are matters which require careful consideration; and in this connection we gather that the firm in question are prepared to submit scheme and tender for any proposed work.

The respective merits of the high-pressure and low-pressure systems of hot-water heating are clearly set forth. The requirements suitable for each individual case are matters regarding which the Wolff Dryer Company, with the fine apparatus at their command, are prepared, it seems, to give their best consideration for the benefit of clients.

### FIRE PREVENTION COMMITTEE'S INDUSTRIAL SECTION.

WE have received a letter from the British Fire Prevention Committee which says:—

The terrible fire in Queen Victoria Street, following so shortly upon the Hackney fire, where seven lives were lost, and upon the Barbican conflagration, where so much property was destroyed, has led many City firms to communicate with the British Fire Prevention Committee either for the purpose of mutual co-operation, or with the view of obtaining advice, and we hence inform you that special arrangements have now been made by which the industrial and commercial establishments of the Metropolis can benefit from the results of the committee's investigations, which have so far only mainly served the purpose of assisting the members of the technical professions.

A special industrial section (the scheme for which has already been under consideration for some time) has now been started in connection with this committee, and is open to all firms of ordinary business standing as well as to responsible representatives of such firms.

The main objects of the Fire Prevention Committee—as we believe is generally known—refer primarily to the protection of life and property from fire by the adoption of *preventive*

measures. The committee uses its influence in every direction towards minimising the possibilities and dangers of fire, and to bring together those scientifically interested in the subject, and to arrange periodical meetings for the purpose of discussing practical questions bearing on the same. The committee's scope includes *independent* testing of fire-resisting materials, methods and appliances, no less than sixty of such tests having been undertaken since its incorporation. Papers on the subject are published periodically, no less than sixty-eight of the committee's red books having been issued.

To meet the particular requirements of business men with regard to the better protection of life and property from fire, the special industrial section now formed will mainly deal with everyday practical requirements of the community rather than with the research side of the question, and the programme of this industrial section may be summarised as follows, namely:—

1. To assist the movement for better fire protection inaugurated by the committee, having special regard to the advantage of practical preventive measures.

2. To bring together those interested in the management of offices, works, factories, mills, refineries, warehouses, &c., in order that special facilities for obtaining immediate information shall be available to all concerned: (a) as to the requirements of public authorities; (b) as to approved methods of construction and equipment; (c) as to tests or experiments with fire-resisting materials or fire appliances; (d) as to the experience gained at actual fires, and (e) as to the organisation of fire watches, private fire brigades, &c.

3. To afford facilities for combined action in respect to the requirements of the public authorities.

4. To arrange periodical meetings for the purpose of discussing practical questions bearing on the subject, to publish and distribute such papers as are of special interest to members of the section, and to form such collections of models, appliances, records and statistics as may be useful for reference.

5. To issue periodical warnings and notices to members, calling attention to specific risks or safeguards.

Each firm joining the section will be represented by one representative, who shall either be a principal, a director, manager, secretary, or skilled adviser to the firm in question. Individual principals, directors, &c., are, however, eligible as members quite apart from the membership of their firm, but at no time shall more than three members of the same firm belong to the section, and for all resolutions relating to the business of the section no one firm shall have more than one vote.

### TILES

PLAIN AND ORNAMENTAL,  
FOR WALLS, HEARTHS, FLOORS.  
EMBOSSSED, GLAZED,  
PRINTED, PAINTED,  
MOSAIC & ENCAUSTIC.

**MOSAIC & C.**

MAW & CO. will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,

Messrs. W. B. SIMPSON & SONS, 97 & 99 St. Martin's Lane, W.C.

The annual subscription for every firm or individual becoming a member has been fixed at two guineas per annum, and for any individual member whose firm is already associated with the section the subscription will be one guinea per annum. The committee's auditors include Mr. James (Messrs. James Edwards), president of the Institute of Chartered Accountants, and all members of the committee give their services voluntarily.

The section will elect its own chairman and vice-chairman, who will also have seats on the council of the general committee, where they will represent the section in all matters relating to its particular interests.

We think that the scientific side of the committee's work has been successful and of value for the members of the professions for whom it was originally mainly intended, and we hence trust that the many City firms interested will also now be able to likewise benefit from practical application of the committee's labours.

We believe that if the business men were to look upon questions of safety from fire in the same way as they realise the importance of attending to questions of hygiene, they will soon—partially by self-help and partially by using their influence with the authorities—be able to rely on that measure of security both for life and property as they to-day enjoy and are officially safeguarded against in respect to bad drainage and its effects.

A SPINNING SCHOOL.

The new Textile School at Ashton-under-Lyne will be opened early next month. The building is close to the Heginbottom Technical School and Free Library. It will supplement and not supplant the old one. The classrooms in the Heginbottom school are too small to hold all the students, and classes have been held in the town hall at some inconvenience to the municipal authorities. The instruction in spinning and weaving has been mainly theoretic hitherto, although it is true that a few spinning machines and also looms are used by the students. Next session the students of Ashton and the district will be able to enter one of the finest schools of spinning in this part of Lancashire. It occupies the ground floor of the new building. The spinning-room measures about 80 feet by 60 feet and the weaving-room 40 feet by 40 feet. A great part of the valuable machinery which fills these rooms has been

given to the school by three townsmen. The equipment is up to date and complete in every way, and comprises all the processes of spinning and weaving, so that a bale of raw cotton brought into the spinning-room can leave the looms as a piece of finished cloth. In the spinning department there is an elaborate series of machines, into the first of which the cotton is put, and it comes out of the last in the shape of "laps," without having been once touched by the hand. The weaving machinery is so arranged as to include processes which are not in general use in the district. On the first floor there are six good classrooms. The two largest measure 60 feet by 40 feet and 40 feet by 29 feet. One of the smaller rooms is to be used for the cookery classes, and in the others teaching in machine drawing, building construction, commercial subjects, &c., will be given. The cost to the technical instruction committee has been about 6,000*l.*, but this figure does not include the cost of the machinery, which has been presented to the school.

NEW WESLEYAN CHAPEL AT BURTON-ON-TRENT.

The Wesleyans of Stapenhill manifested considerable interest in the opening on the 11th inst. of a new chapel and school-room. The new buildings are set back from the street, and enclosed within a brick and iron palisading. The chapel is approached from Ferry Street by the two large entrance doorways which have been designed to make a central feature. These lead into a large vestibule extending the whole width of the chapel, and thus form a very convenient lobby for waiting, and hats and cloaks. The edifice affords accommodation for 400 adults—190 in the central nave, 136 in the side aisles, 50 in one transept, and 24 (together with the organ) in the second transept, this latter forming the choir. The roof is of pitch pine, and the whole of the constructional timbers are ornamented, wrought and varnished. The schoolroom is built at the back of the chapel, and connected thereto by means of a large archway filled in with a framed wooden screen, which may be easily taken down when the two buildings are used for special services, school anniversaries, &c. The chapel is lighted by means of one large four-light window in the front gable, two two-light windows in the transepts, and twelve single-light windows in the aisles. The transepts are divided from the nave by octagonal stone pillars and arches. The schools have the entrance from the Dingle, and provide accommodation for

300 children. These are provided with two cloakrooms adjoining the entrance vestibule, and at the other end of the schools is separate lavatory accommodation for boys and girls. The other buildings comprise a minister's vestry, with a separate entrance to the school and chapel, and a kitchen (with heating apparatus) in the basement. The heating is on the low-pressure system, and ventilation is secured by means of numerous air-inlet panels and roof exhaust ventilating pumps. The drainage is absolutely perfect, and where the pipes in one place pass under the kitchen and passage they are cast-iron and lined with glass. The buildings are designed in the Early English style of architecture, and externally are of pressed red bricks with white stone dressings, and the roof is covered with red tiles. The glazing is of tinted cathedral glass, in plain ecclesiastical leadings. The contractors are Messrs. Thomas Lowe & Sons, whose estimate is 2,240*l.*, and the architect Mr. Thomas Jenkins, of 35 High Street.

### NEW HOSPITAL, EAST HAM.

THE Countess of Warwick visited East Ham on the 12th inst. in order to formally open the new Passmore Edwards Hospital, which has been erected in Shrewsbury Road, from designs and under the superintendence of Mr. Sylvanus Trevail, F.R.I.B.A., of Palace Chambers, Westminster, and Truro, who also designed the East Ham Public Library, and many others of Mr. Passmore Edwards's buildings.

The aim of the architect has been in the first place to give the greatest and most perfect accommodation for hospital purposes with the sum placed at his disposal by the donor; and after this to give, in a plain and simple way, the most "homelike" effect possible for a building devoted to such an errand of mercy. In too many instances hospitals have a coldness about them repellent to both the patient and their friends. In the present instance it is hoped that the cosy and snug appearance of the group will have the tendency of attracting, and so be productive of contentment among the sufferers, and incidentally of an earlier cure. In the development of this feature, Mr. Trevail has been very materially assisted by the natural situation and characteristics of the site, which leave little or nothing to be desired. It abuts on one of the favourite and principal thoroughfares of East Ham—Shrewsbury Road. The grounds and site of the pro-

posed hospital are well wooded, and will make a very effective setting to the building, as may be gathered by the general view. The hospital will comprise a central block, containing on the ground floor a spacious central entrance, with a reception or observation room (15 feet by 12 feet) to the left, and the matron's room on the right, each with a circular bay window. From the main entrance wide and well-lighted corridors extend right and left to the men's, children's and women's wards, whilst immediately across these corridors and to the rear is the administrative department, having a kitchen, 20 feet by 17 feet; dispensary, 11 feet by 9 feet; surgery or operating room, 15 feet by 11 feet, with both top and side lights, and in communication with the dispensary, besides having an external approach. Besides these are larders, pantry, coal store, washhouse, yard, and a mortuary. Over the main portion of the central block are five bedrooms for the matron, day and night nurses, and servants, with bathroom, store, closets, &c.

The wards proper of the hospital are arranged right and left from the administrative block, for economy of service, as well as for symmetrical appearance. That on the right of the main entrance contains a men's ward, 32 feet by 16 feet, accommodating seven beds; a children's ward, 17 feet by 14 feet, with four beds, and a single room for one bed, with a linen room. The sanitary annexe is a special feature, designed with great care, by being placed entirely external to the wards excepting by corridor, which has window openings on opposite sides, by which cross ventilation is secured, and all chance of offensive smell is quite cut off. It comprises patients' bathroom, w.c., and slop closet. The women's wing is to the left of the main entrance, and corresponds precisely in dimensions, accommodation and sanitary block, with that of the men, excepting that the corresponding room to that provided for the children on the other side is here made a nurses' room. The total accommodation at present proposed is for twenty patients. Provision is made for an extension by duplicating both principal wards on the ground floor, whilst it may be quadrupled by placing an upper floor over the whole of the extended wings to correspond with the central block, should the necessities of the future development of the district demand it. The architect, in considering this eventuality, has designed the kitchen and offices of ample dimensions, and the sanitary blocks in such a position as will admit of their equally convenient use for the first portion of the building, and its ultimate extensions. This will also apply to upper floor extensions.

where these blocks can be duplicated by having another storey with similar means of approach and cross ventilation. In the matter of lighting, heating and ventilation, the greatest care has been exercised, and altogether the building, when finished, will be one of the most convenient and complete establishments of the kind to be found in the suburbs.

### PORTLAND CEMENT.\*

IN 1824 one Joseph Aspden, a bricklayer of Leeds, England, patented an artificial cement, which he called Portland cement, because of its supposed resemblance in colour and texture to the celebrated Portland building stone. Aspden appears to have established a factory for the manufacture of this cement at Wakefield, in Yorkshire, in 1825, and the mode of manufacture carried on thereat appears to have been, according to the specification of his patent, the mixing of specific quantities of argillaceous earths or clays with specific quantities of puddled and powdered limestone, the compound being dried and calcined. All the carbonic acid was expelled. The calcined mixture was ground to a powder, which was then ready for use. Although the article produced by Aspden differed greatly from that is to-day known as Portland cement, inasmuch that the calcination was not carried to the point of incipient vitrification, which is now recognised as essential, the principle underlying its manufacture—viz. the amalgamation of limestone and clay, and the subsequent calcination of the compound—was the same.

Aspden's cement appears, however, to have commended itself to engineers of his day, for we learn that in 1828 Sir J. Brunel used his product in constructing the Thames Tunnel. In 1825 a Mr. Frost commenced the manufacture of Portland cement from chalk and clay at Swanscombe, and carried on his business till 1833, when his interests were acquired by Mr. John Bazeley White, sen. From these small beginnings sprang the immense and important industry we now find, the vested interests in which in the Thames and Medway districts represent a capital of 5,000,000*l*.

Portland cement may be manufactured under two distinct

processes, viz. the wet and the dry. The choice of the process to be adopted depends entirely upon the character of the materials to be treated, and it should here be stated that either process may be subjected to considerable modification to suit local conditions. In the Thames district the raw materials—chalk and river clay—lend themselves to treatment by the wet process. The chalk and clay, after being carefully weighed in proportions which are regulated by the works' chemist, are tipped into a circular pit called a wash-mill, into which a small stream of water is constantly running. In the mill, which is some 15 feet or so in diameter by 3 or 4 feet deep, revolve a number of harrows. These revolving harrows, aided by the water, reduce the chalk and clay to a thick paste called "slurry," which is forced by the wash of the contents of the mill through narrow gratings extending along a portion of its circumference. From the wash-mill the slurry is conveyed by means of chutes and elevators to the wet mill, and is there passed through millstones or other suitable reducing machinery. This grinding of the slurry, which has for its object the reduction of any coarse particles that may have escaped from the wash-mill, is called the Goreham process, and is a modification of the original wet process, *i.e.* the "back" system, which is now practically abandoned. From the wet mill the slurry runs into a pit or sump, from whence it is pumped or elevated to floors, on which it is spread, and afterwards dried by means of waste heat from the calcining kilns or other suitable means. When sufficiently dry this slurry, then called "slip," is broken into lumps of suitable size and conveyed to the kilns.

I will here leave the wet process, and endeavour to give you a description of the other, *i.e.* the dry process up to the point of calcination, from which stage both processes are conducted upon similar lines. The dry process is adopted where raw materials, such as limestones and shales, cannot be treated by the simpler wet process. For example, at Rugby, in England, where cement is made from the blue lias deposits; at Fyansford, near Geelong, where the eocene limestone from the Moorabool district and alluvial clay are used; and at Richmond, Victoria, where cement is made from mountain limestone obtained from Lilydale, and fresh water limestone and marl from Lara. This process is the one generally adopted on the Continent of Europe, in America, and elsewhere, and is now more universal than the other. The limestone and marl clay or shale, after being dried either in air or by means of some suitable apparatus, such as the Cumber, or other drier, are, as with the chalk and clay, carefully weighed in the

ROAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

required proportions, and thereafter passed through a succession of reducing machines, such as rock-breakers and pan mills for preliminary grinding, and mill stones or tube mills for finishing until they are reduced to a very fine powder. This raw powder, as it is now called, is next conveyed to a mixer, where it is slightly damped, and from the mixer to a suitable brick-making machine, where it is made into bricks or lumps. These bricks are then conveyed to drying chambers to be dried, as in the case of the slurry, by waste heat from the kilns or other suitable means, or, in cases where climatic conditions are favourable, to open drying sheds to be air-dried, or, again, if the material permits of a very small quantity of water being used for brick-making, they are taken direct to the calcining kiln.

The styles of calcining kilns vary greatly, each class having, as usual, its own distinctive merits and disadvantages. The usual, though now somewhat out-of-date class, is the old bell-shaped intermittent kiln. In this kiln the lumps of slip or dried bricks are placed in layers, or "covers," alternating with layers of fuel, generally gas coke. When full the kiln is lit, allowed to burn through, and when cool its contents are drawn, and the kiln again filled. Another class of kiln is the continuous, such as the "Dietsch." In these kilns the calcining chamber is kept continuously full, being fed with a supply of bricks from a vertical drying chamber situated above the kiln, the requisite amount of fuel, generally small coal, being introduced with each charge. The resulting clinker passes vertically into a cooling chamber below, from which it is drawn at intervals. The most modern method of burning is by rotary furnaces, and their use partly revolutionises the process of cement making, inasmuch that, instead of being made into bricks, the raw powder is conducted to the rotary kiln direct from the reducing machinery. The rotary furnace consists of a cylinder some 60 feet long by 6 feet in diameter. The cylinder, which is lined with fire-brick or lumps, is upon an inclined plane, and revolves slowly upon its axis. The powder enters the cylinder at its upper end, and is met by a strong flame, which is fed by means of finely-ground coal injected under pressure at the lower end. In its progress through the cylinder the raw powder becomes calcined, and emerges at the lower end of the furnace in the form of small lumps of cement clinker, which are therefrom conveyed to suitably arranged cooling chambers. The honour of applying the rotary furnace to cement burning belongs to an Englishman, a Mr. Ransome, who introduced the process some years ago. The Ransome

cylinder, although it created considerable sensation in the cement-making world at the time of its introduction, never got beyond the experimental stage, owing to some then apparently insurmountable difficulty in regulating the temperature.

After leaving the kiln the cement clinker, which has been calcined to the point of incipient vitrification, and from which all under-burnt portions have been removed to be returned to the kiln, is subjected to the last mechanical stage in the process of cement making, *i.e.* reduction to a fine powder. This is effected by passing the clinker through a succession of suitable reducing machines, such as rock breakers and ball mills for preliminary reduction, and mill stones or tube mills for finishing. The cement powder is then taken by means of elevators and conveyors to the warehouse, where it is allowed to remain until ready for bagging or casking. Portland cement making is an important branch of manufacturing chemistry. The selection of the raw materials to be used should be made with the greatest care, attention being paid not only to their chemical constituents, but also to their mechanical condition. The former with the object of ascertaining whether they contain sufficient quantities of necessary, and are free from undesirable, elements, and the latter with a view to their economical treatment. The constituents of a normal Portland cement usually vary within the following proportions:—

Ca O	from 58 to 65 per cent.
Si O <sub>2</sub>	" 20 to 27 "
Al <sub>2</sub> O <sub>3</sub>	" 4 to 9 "
Fe <sub>2</sub> O <sub>3</sub>	" 2 to 6 "
Mg O	not more than 3 "
S O <sub>3</sub>	" " 2 "
Alkalies	from traces to 2 "

The cement should be hard, in order that it may withstand crushing strains and abrasions, and tough, to withstand strains in tension. It should be of a cold grey colour, set comparatively slowly, but harden rapidly; should be free from expansion, and should be strongly adhesive as well as cohesive. To arrive at these desirable results, the cement maker must carefully regulate the proportions of his raw materials. He must see that they are thoroughly mixed, and ground as finely as possible, with the object of evenly distributing the constituents of his compound, and bringing the particles into the closest possible mechanical contact in order that perfect chemical combination may take place in the kiln.

(To be concluded.)
